

# 1 Pathways for Mitigation

## 2 Transportation – Summary Statement

3 Transportation – the movement of people and goods – is essential to the state’s economy and  
4 Vermonter’s quality of life. The state’s rural character and low population density also means  
5 that Vermonters depend primarily on cars and trucks to get them where they need to go.

6 Vermont’s auto-reliant system is fueled with a heavy dependence <sup>1</sup> on carbon-intensive gasoline  
7 and diesel, making transportation the largest source of climate pollution – equating to almost  
8 40% of the state’s greenhouse gas emissions. <sup>2</sup> The combination of our mostly rural nature,  
9 dispersed land use patterns, and heavy reliance on fossil-fueled vehicles is a significant reason  
10 why Vermonters emit more greenhouse gasses per capita than any other state in New England. <sup>3</sup>

11 This reality makes transforming the state’s transportation system essential to meeting the  
12 emissions reduction requirements of the Global Warming Solutions Act. At the same time,  
13 creating a clean, efficient, multi-modal system will also have economic, environmental, equity  
14 and public health benefits.

15  
16 Vermont’s reliance on liquid fossil fuels is a significant drain on our economy. The largest share  
17 of Vermonters’ energy expenditures is for fossil fuels for transportation (mostly gasoline),  
18 equating to 45% of total energy expenditures on average. Vermonters collectively spend over \$1  
19 billion per year on fossil fuels for transportation. <sup>4</sup> Approximately 75% of those dollars leave the  
20 state’s economy. <sup>5</sup> In contrast, electricity purchases keep far more dollars in Vermont, with about  
21 60% of every dollar spent on electricity staying and recirculating in state. <sup>6</sup> Moving to more

22 efficient, electric vehicles will keep more of the money we collectively spend on transportation  
23 in the state’s economy and in Vermonters’ pockets.<sup>7</sup>

24  
25 Higher per capita costs and high price volatility in the current system also makes transportation  
26 an equity issue.<sup>8</sup> Lower-income Vermonters spend a far greater proportion of their incomes on  
27 energy than upper income Vermonters. Transportation costs – primarily through owning,  
28 operating and maintaining a vehicle – equate to 45% of total energy expenditures for the average  
29 Vermont household. This reality places a disproportionate economic burden on lower income  
30 Vermonters.<sup>9</sup>

31  
32 The current system’s failure to serve people equally is another equity concern. Many older  
33 Vermonters, youth, and people living with disabilities cannot drive, thus limiting their ability to  
34 access jobs, services and community amenities without a multi-modal, integrated transportation  
35 system. Research highlights that vehicle ownership is a significant requirement for job access  
36 and retention for lower income Vermonters.<sup>10</sup> This has long been true and was underscored in  
37 the COVID-19 pandemic, when many low-income, frontline workers continued to report in-  
38 person to work, often relying on costly and inefficient vehicles. Research also found that  
39 “possession of a driver’s license and a car was a stronger predictor of leaving public assistance  
40 than even a high school diploma,” which speaks to the importance of vehicle access and  
41 ownership as an important justice issue.<sup>11</sup>

42  
43 The economic disparities and equity issues embedded in rural Vermont’s current transportation  
44 system present opportunities. Equitably accelerating the adoption of more efficient, electric  
45 vehicles, expanding transportation choices, and creating compact communities where

<sup>11</sup> <https://www.sierraclub.org/sites/www.sierraclub.org/files/sce-authors/u2196/Arrive%20Together%20Transportation%20Access%20and%20Equity%20in%20Wisconsin.pdf>

46 Vermonters can afford to live without a vehicle will have many benefits. Those benefits include  
47 collectively saving Vermonters hundreds of millions of dollars every year; significantly reducing  
48 the high energy burdens Vermonters currently face; ensuring Vermonters of all incomes levels  
49 and demographics can access more clean, affordable transportation options; and – individually  
50 and collectively – improving public health outcomes by reducing exposure to the air pollutants  
51 caused by the burning of gasoline and diesel and expanding active modes of transportation. <sup>12</sup>

52  
53 Together, the strategies identified below will not only improve health outcomes and save  
54 Vermonters money, but set the state on a course to reduce transportation-related carbon pollution  
55 and more equitably shift to a cleaner, more efficient, multi-modal transportation system. This is a  
56 two-pronged approach to make both vehicles and the transportation system more efficient by:

57  
58 1. Replacing carbon intensive fuels (gas and diesel) with zero emission or low carbon fuels  
59 including electricity for cars and light duty trucks and biofuels and hydrogen for medium and  
60 heavy duty vehicles.

61  
62 2. Making both the vehicles and the transportation system more energy efficient by creating  
63 options for Vermonters to drive less or use alternatives to the single occupancy vehicle to get  
64 where they need to go, while also increasing options for those who cannot drive.

65  
66 Electrification is a critical priority. Many new and used electric vehicles are available for  
67 purchase. They are more energy efficient than gas powered vehicles and cost far less per mile  
68 than a gas-powered vehicle to own and operate over time.<sup>13</sup> This means that rural Vermont  
69 drivers will see significant savings.. A recent study estimated that a typical rural driver can save  
70 approximately \$1,500 per year by switching from a conventional gasoline car to a comparable  
71 electric vehicle, made even more significant over the life of the vehicle <sup>14</sup>

72

<sup>14</sup> <https://www.ucsusa.org/about/news/rural-communities-could-benefit-most-electric-vehicles>

73 Avoiding car trips, reducing car trip lengths, and/or replacing car trips with clean and energy  
74 efficient transit, biking and walking options, carpool and rideshare programs and other non-  
75 single occupancy vehicle strategies have economic, equity and public health benefits – while  
76 also being important pollution reduction measures to achieve 2050 emissions reduction  
77 obligations. These transportation options rely on compact community settlement patterns, thus  
78 requiring short- and long-term investments in key community infrastructure and affordable  
79 housing to create walkable, bikeable, and transit friendly places where people want and can  
80 afford to live.

81  
82 Transitioning to a cleaner transportation system can have public health benefits. A recent  
83 analysis by the American Lung Association found that residents in every region of the U.S. stand  
84 to benefit from the elimination of on-road traffic pollution and clean, renewable electric  
85 generation. It is estimated that, by 2050, a cleaner transportation system could net Vermont over  
86 \$73 million in value from avoided premature deaths, asthma attacks and work days lost.<sup>15</sup>

87  
88 The pathways and actions described below will help put Vermont on a path to significant climate  
89 progress, respond to Vermonters’ diverse transportation needs and provide numerous co-  
90 benefits.

91  
92 The pathways include:

- 93 • Adopting a cap and invest policy including but not limited to the transportation sector to  
94 achieve GWSA obligations and create a sustainable revenue source for carbon- and cost-  
95 reducing transportation programs.
- 96 • Reducing greenhouse gas emissions from vehicles.
- 97 • Lowering the carbon intensity of fuels.
- 98 • Reducing Vehicle Miles Traveled through smart land use strategies and approaches.

99  
100 The transformation of the current transportation system will evolve and be an iterative process,  
101 happening swiftly in the near term with Vermonters saving on energy costs by eliminating their  
102 reliance on fossil fuel vehicles while also achieving the state’s mandatory greenhouse gas

---

<sup>15</sup> <https://www.lung.org/getmedia/99cc945c-47f2-4ba9-ba59-14c311ca332a/electric-vehicle-report.pdf>

103 emissions reductions. This means steps such as implementing an electric vehicle point of sale  
104 purchase or lease financial incentive. Point of sale is a critical moment that helps car owners  
105 avoid locking into a high-emitting fossil fuel vehicle that may be on the road for a decade or  
106 more.

107  
108 Attention must be paid to understanding the realities facing all Vermonters through public  
109 engagement strategies and crafting programs and policies that respond to Vermonters' diverse  
110 needs as well as mitigate potential negative (cost) impacts from the transition away from single-  
111 occupancy and fossil fueled modes of transportation. As this essential and inevitable  
112 transportation transformation ramps, Vermont must work to ensure no one is left behind and,  
113 instead, has the support to access and afford cleaner, more cost effective transportation solutions.

### 114 115 **Transportation Progress Since the 2021 Adopted Climate Action Plan:**

116 As recommended in the 2021 Climate Action Plan, Vermont moved forward with the adoption of  
117 the next phase of our state's long-standing participation in California's clean vehicle programs.  
118 In 2022, Vermont adopted both the Advanced Clean Cars (ACC) II program and the Advanced  
119 Clean Trucks (ACT) regulation. ACC II promotes the electrification of light-duty cars, requiring  
120 automakers to deliver a gradually increasing percentage of zero-emission vehicles into the  
121 Vermont market, eventually putting the state's car and light truck sales on a pathway toward 100  
122 percent new electric vehicle sales by 2035. The ACT rule requires manufacturers to produce and  
123 sell an increasing percentage of zero-emission trucks and buses annually through 2035. Both  
124 programs – ACC II in particular – are foundational to achieving the targets of the GWSA.

125  
126 Since the last CAP, Vermont also leveraged an unparalleled influx of federal funds to support  
127 investments in cleaner transportation. That included significant investments in electric vehicle  
128 incentive programs and EV charging infrastructure, helping support thousands of Vermonters in  
129 reducing pollution and saving money by switching to electric vehicles, with nearly 18,000 EVs  
130 registered in Vermont as of January 2025.<sup>16</sup> Federal and state funds also enabled significant  
131 investments in climate and equity-focused programs, like Mileage Smart and Replace Your Ride

---

<sup>16</sup> [https://www.driveselectricvt.com/uploads/media/Documents/Maps/vt\\_ev\\_registration\\_trends.pdf](https://www.driveselectricvt.com/uploads/media/Documents/Maps/vt_ev_registration_trends.pdf)

132 as well as additional and important investments in electric bicycle and non-vehicular modes of  
133 transportation, including additional investments in transit, micro-transit, bicycle and pedestrian  
134 infrastructure and land use strategies that support more compact, energy efficient development.

135  
136 These have been two significant areas of progress in the transportation sector since the initial  
137 Climate Action Plan was adopted. At the same time, Vermont remains without a primary  
138 regulatory or policy tool to reduce emissions – equitably and with certainty – in line with the  
139 obligations of the GWSA. Two significant analyses of potential approaches – including the most  
140 cost-effective, equitable approaches – have been undertaken since December 2021. Those  
141 include the federally required [Carbon Reduction Strategy](#) analysis as well as a [climate policy](#)  
142 [study](#) that examined the costs, benefits, key considerations, and likely pollution-reduction  
143 outcomes of various transportation policy, regulatory and programmatic approaches. Each of  
144 these efforts were informed by significant public engagement, and each underscored the  
145 importance of vehicle electrification as key to reducing greenhouse gas emissions and  
146 transportation pollution in our rural state. Each analysis also recognized the long-term pollution-  
147 reducing benefits of smart land use and development practices, as well as the shorter-term co-  
148 benefits of transportation options other than a single-occupancy vehicle (public health, important  
149 equity and access considerations, etc).

150  
151 The climate policy analysis also found that there is a path to help Vermonters shift from fossil  
152 fuel dependence, reducing overall energy costs while also putting Vermont on a path to  
153 significantly cut climate pollution. The report’s findings made clear that Vermont and  
154 Vermonters can save money over time by investing in cleaner, more cost-effective energy. The  
155 report also highlighted the ability to ensure lower and middle-income Vermonters save money  
156 and come out ahead with a combination of rebates and incentives. As other jurisdictions have  
157 done, it would be possible – and important – to design a program to protect low- and moderate-  
158 income Vermonters from bearing additional costs from a potential program.

159  
160 [As re-affirmed by the Vermont Climate Council in November 2022](#), it remains clear that “(t)he  
161 *only currently known policy options for which there is strong evidence from other states,*  
162 *provinces and countries of the ability to confidently deliver the scale and pace of emissions*

163 *reductions that are required of the transportation sector by the GWSA are one or a combination*  
164 *of: a) a cap and invest/cap and reduce policy covering transportation fuels and/or b) a*  
165 *performance standard/performance-based regulatory approach covering transportation fuels.”*  
166 Further work to refine and advance the most effective, affordable, and equitable approach in this  
167 arena remains and will be imperative to meeting Vermont’s climate commitments and  
168 transportation affordability goals.
