SECTION 1: INTRODUCTION

Vermont is reviewing its child support guidelines. Federal regulation (Title 45 of the Code of Federal Regulations, C.F.R. § 302.56) requires states to review their guidelines at least once every four years. As part of that review, states must consider economic data on the cost of raising children, examine case file data to analyze the application and deviation from the guidelines, consider labor market data, and fulfill other requirements. This report documents Vermont's fulfillment of the review of economic data on the cost of raising children and consideration of labor market data. Current economic data is used to prepare an updated Vermont Table of Intact Family Expenditures on Children. Updated Adjusted Gross to Tax Income Conversion Tables are also provided in this report.

Vermont last reviewed its child support tables in 2019.¹ Vermont Child Support Guidelines are prescribed in state statute (15 V.S.A § 654) and set by administrative rule.² They are to be used by all judges and officials who can establish or modify a child support order within the state. The guidelines-determined amount is to be considered the amount of the child support obligation unless the court finds that the amount would be unjust or inappropriate.

THE CURRENT VERMONT GUIDELINES

The current Vermont guidelines consist of numerous tables and worksheets that consider the economic cost of raising children and standardized tax formulas and tax assumptions for converting each parent's gross income to income available for child support. A standardized tax formula means that two parents with the same income (e.g., a paying parent) but different tax circumstances (e.g., one parent can deduct mortgage interest while the other parent cannot because that parent rents) are treated equally—that is, they have the same after-tax income used for the guideline calculation.

Each of the worksheets addresses a specific custody situation: sole custody, split custody, and shared custody. There are three major tables:

- Tax Conversion Table for Sole and Split Custody Cases;
- Tax Conversion Table for Shared Custody Cases; and
- Table of Intact Family Expenditures on Children (Guideline Table).

Each is color-coded. The Tax Conversion Table for Sole and Split Custody Cases is formatted in yellow, the Tax Conversion Table for Shared Custody is formatted in pink, and the Table of Intact Family Expenditures on Children is formatted in blue. Exhibit 1 shows excerpts from each of the three tables.

Exhibit 1: Excerpts from Vermont Guidelines Tables

ADJUSTED GROSS TO AFTER TAX INCOME CONVERSION TABLE After Tax Incomes for Custodial and Noncustodial Parents and Different Numbers of Children (SOLE OR SPLIT CUSTODY)							
Monthly Adjusted Gross Income Range	Custodial Parent After Tax Income (Sole or Split Custody)						Noncustodial Parent After Tax Income
	One Child	Two Children	Three Children	Four Children	Five Children	Six Children	
0.00 – 0.00	0	0	0	0	0	0	0
1.00 – 74.99	68	72	76	76	76	76	51
75.00 – 124.99	138	146	152	152	152	152	103
125.00 – 174.99	207	219	229	229	229	229	154
175.00 – 224.99	276	292	306	306	306	306	205
225.00 – 274.99	352	372	389	389	389	389	257
275.00 – 324.99	429	453	473	473	473	473	308

ADJUSTED GROSS TO AFTER TAX INCOME CONVERSION TABLE After Tax Incomes for Either Parent and Different Numbers of Children (SHARED CUSTODY)							
Monthly Adjusted Gross Income Range	Custodial Parent After Tax Income (Shared Custody)						Noncustodial Parent After Tax Income
	One Child	Two Children	Three Children	Four Children	Five Children	Six Children	
0.00 – 0.00	0	0	0	0	0	0	0
1.00 – 74.99	68	71	75	75	75	75	75
75.00 – 124.99	136	144	151	151	151	151	151
125.00 – 174.99	205	217	226	226	226	226	226
175.00 – 224.99	274	289	302	302	302	302	302
225.00 – 274.99	342	362	378	378	378	378	378
275.00 – 324.99	418	442	462	462	462	462	462

Vermont Table of Intact Family Expenditures on Children						
Monthly Combined Available Income	One Child	Two Children	Three Children	Four Children	Five Children	Six Children
625.00 – 674.99	143	221	274	306	337	366
675.00 – 724.99	154	238	295	330	363	394
725.00 – 774.99	165	255	316	353	389	422
775.00 – 824.99	176	272	337	377	415	451
825.00 – 874.99	187	289	358	400	440	479
875.00 – 924.99	198	306	380	424	466	507
925.00 – 974.99	209	323	401	448	492	535
975.00 – 1024.99	220	340	422	471	518	563

Calculating the guidelines amount requires several steps and use of these tables. The first step involves disclosure of each parent's gross income. In the second step, each parent's gross income is converted to income available for child support using a tax conversion table. For example, if there is sole custody and each parent's gross income is \$324.99 per month, the after-tax income for a custodial parent with one child would be \$429 per month and the after-tax income for a noncustodial parent would be \$308 per month. The tax conversion is based on a standardized tax formula that considers both federal and state taxes including the federal and state earned income tax credits. It assumes, as required by statute, that each parent claims himself or herself as an exemption, the custodial parent in sole custody cases also claims the number of children for whom support is being determined, and parents in shared custody cases split the exemptions for the number of children for whom support is being determined.

Besides the standardized adjustments for taxes, there are other income adjustments permissible under the guidelines (e.g., deduction for payment of another child support order). Once each parent's income available for support is determined, the parents' incomes are added to produce a combined family income. Continuing with the example above, if there are no other income adjustments, the combined family income is \$737 per month. The custodial parent's prorated share is 58% and the noncustodial parent's prorated share is 42%.

In the next step, the combined family is applied to the Guideline Table to determine the amount that a family of that income and size typically spends on children if they lived together and shared financial resources. The amount from this table is the basic support obligation. For a combined family income of \$737 per month and one child, the amount would be \$165 per month. It does not include childcare expenses and the extraordinary medical expenses of the child. The actual amount expended on childcare and the child's healthcare in a particular case is considered in the guidelines calculation on a case-by-case basis. The actual amount is added to the basic support obligation to develop a parental support obligation. Each parent is responsible for his or her prorated share of the parental support obligation. In sole custody cases, the noncustodial parent's prorated share becomes the basis of the support award, although there may be other considerations as provided in the guidelines such as the noncustodial parent's ability to pay. Continuing with the earlier example (and assuming there are no add-ons for child care or the child's extraordinary medical expenses), the noncustodial parent's share is 42% of \$165, which is \$69 per month. In other custody situations, there are additional adjustments to account for the child's time with each parent or the number of children living with each parent.

The existing tax conversion tables and the Guideline Table were developed in 2019. They reflect the most current economic data at the time. This includes economic data on the cost of child rearing, price levels, federal and state tax rates, and FICA.

As part of the review and to fulfill a federal requirement, more current economic data on the cost of raising children is considered later in this report.

FEDERAL REQUIREMENTS OF STATE GUIDELINES

Exhibit 2 shows the federal rules requiring statewide guidelines and the periodic review of child support guidelines.

The major requirements of a state guidelines are to:

- Have one set of guidelines to be used by judges (and all persons within a state with the authority) to issue a child support order;
- Provide that the child support order is based on evidence to pay;
- Consider all earnings and income of the paying parent (and, at state's discretion, the custodial parent) in the calculation of support;
- Provide for the child's healthcare coverage;
- Consider the subsistence needs of the paying-parent through a self-support reserve or another type of low-income adjustment;
- Consider the actual circumstances of the paying-parent (and the receiving parent at state's discretion) when income imputation is authorized;
- Provide that incarceration is not voluntary unemployment; and
- Review their guidelines at least once every four years and, as part of that review, consider economic data on the cost of raising children; analyze case file data on the application of and deviations from the guidelines; analyze labor market data; and analyze payment data and frequency of defaults, income imputation, and application of the low-income adjustment.

ORGANIZATION OF REPORT

Section 2 provides an analysis of the economic data on the cost of child-rearing. Section 3 develops an updated Guideline Table and gross-to-net income conversion tables. Section 4 compares the impact of the updated tables to the current guidelines amounts and guidelines of bordering states using case scenarios and consideration of labor market data. Section 5 provides a conclusion.

Exhibit 2: Federal Regulations Pertaining to State Child Support Guidelines

45 C.F.R. § 302.56 Guidelines for setting child support orders

- (a) Within 1 year after completion of the State's next quadrennial review of its child support guidelines, that commences more than 1 year after publication of the final rule, in accordance with § 302.56(e), as a condition of approval of its State plan, the State must establish one set of child support guidelines by law or by judicial or administrative action for setting and modifying child support order amounts within the State that meet the requirements in this section.
- (b) The State must have procedures for making the guidelines available to all persons in the State.
- (c) The child support guidelines established under paragraph (a) of this section must at a minimum:
 - (1) Provide that the child support order is based on the noncustodial parent's earnings, income, and other evidence of ability to pay that:
 - (i) Takes into consideration all earnings and income of the noncustodial parent (and at the State's discretion, the custodial parent);
 - (ii) Takes into consideration the basic subsistence needs of the noncustodial parent (and at the State's discretion, the custodial parent and children) who has a limited ability to pay by incorporating a low-income adjustment, such as a self-support reserve or some other method determined by the State; and
 - (iii) If imputation of income is authorized, takes into consideration the specific circumstances of the noncustodial parent (and at the State's discretion, the custodial parent) to the extent known, including such factors as the noncustodial parent's assets, residence, employment and earnings history, job skills, educational attainment, literacy, age, health, criminal record and other employment barriers, and record of seeking work, as well as the local job market, the availability of employers willing to hire the noncustodial parent, prevailing earnings level in the local community, and other relevant background factors in the case.
 - (2) Address how the parents will provide for the child's health care needs through private or public health care coverage and/or through cash medical support;
 - (3) Provide that incarceration may not be treated as voluntary unemployment in establishing or modifying support orders; and
 - (4) Be based on specific descriptive and numeric criteria and result in a computation of the child support obligation.
- (d) The State must include a copy of the child support guidelines in its State plan.
- (e) The State must review, and revise, if appropriate, the child support guidelines established under paragraph (a) of this section at least once every four years to ensure that their application results in the determination of appropriate child support order amounts. The State shall publish on the internet and make accessible to the public all reports of the guidelines reviewing body, the membership of the reviewing body, the effective date of the guidelines, and the date of the next quadrennial review.
- (f) The State must provide that there will be a rebuttable presumption, in any judicial or administrative proceeding for the establishment and modification of a child support order, that the amount of the order which would result from the application of the child support guidelines established under paragraph (a) of this section is the correct amount of child support to be ordered.
- (g) A written finding or specific finding on the record of a judicial or administrative proceeding for the establishment or modification of a child support order that the application of the child support guidelines established under paragraph (a) of this section would be unjust or inappropriate in a particular case will be sufficient to rebut the presumption in that case, as determined under criteria established by the State. Such criteria must take into consideration the best interests of the child. Findings that rebut the child support guidelines shall state the amount of support that would have been required under the guidelines and include a justification of why the order varies from the guidelines.
- (h) As part of the review of a State's child support guidelines required under paragraph (e) of this section, a State must:
 - (1) Consider economic data on the cost of raising children, labor market data (such as unemployment rates, employment rates, hours worked, and earnings) by occupation and skill-level for the State and local job markets, the impact of guidelines policies and amounts on custodial and noncustodial parents who have family incomes below 200 percent of the Federal poverty level, and factors that influence employment rates among noncustodial parents and compliance with child support orders;
 - (2) Analyze case data, gathered through sampling or other methods, on the application of and deviations from the child support guidelines, as well as the rates of default and imputed child support orders and orders determined using the low-income adjustment required under paragraph (c)(1)(ii) of this section. The analysis must also include a comparison of payments on child support orders by case characteristics, including whether the order was entered by default, based on imputed income, or determined using the low-income adjustment required under paragraph (c)(1)(ii). The analysis of the data must be used in the State's review of the child support guidelines to ensure that deviations from the guidelines are limited and guideline amounts are appropriate based on criteria established by the State under paragraph (g); and
 - (3) Provide a meaningful opportunity for public input, including input from low-income custodial and noncustodial parents and their representatives. The State must also obtain the views and advice of the State child support agency funded under title IV-D of the Act.

SECTION 2: ECONOMIC DATA ON COST OF CHILD-REARING

Child support formulas/tables are part policy and part economic data. Most state guidelines, including Vermont's guidelines, rely on a study of child-rearing expenditures as the underlying basis of their child support table or formula. Federal regulation (45 C.F.R. § 302.56 (h)(1)) requires states to consider economic data on the cost of raising children as part of a state's child support guidelines review. The intent is to use the information to assess the adequacy and appropriateness of the state's child support formula/table and revise it, if appropriate.

BACKGROUND INFORMATION: GUIDELINES MODELS AND OVERVIEW OF ECONOMIC BASIS

In order to understand whether the Vermont guidelines table should be updated using more current economic data, it is important to understand its underlying guidelines model and the basis of the existing table.

Guidelines Models

The Vermont child support guidelines table is known as the "Table of Intact Family Expenditures on Children." Most state guidelines base their child support tables on measurements of child-rearing expenditures in intact families. This is consistent with the income shares model that forms the basis of 41 states (including Vermont) and the District of Columbia.³ The income shares model was developed through the 1983–1987 National Child Support Guidelines, which was convened by the federal Office of Child Support Enforcement (OCSE) to fulfill a congressional request.⁴ At the time, most states did not have statewide child support guidelines. The architects of the incomes shares model designed it to fulfill the guidelines principles identified by the project's oversight committee, which included a wide range of stakeholders. Examples of some of the principles are the financial responsibility of the children should be shared by the parents who have legal responsibility for the children; child support guidelines should at least cover a child's basic needs, but the child should also share a higher standard of living enjoyed by a parent; the subsistence needs of each parent should be taken into consideration; and each child of a given parent should have a right to that parent's income. One of the major principles is that the child support obligation should allow the children to benefit from the same level of expenditures had the children and both parents lived together. To this end it, the income shares schedule relates to expenditures in intact families. The principle is that children of divorcing and separating parents, as well as never-married parents, should be treated the same regardless of their parents' decisions to marry, divorce, separate, or never marry. Vermont statute essentially requires the use of the income shares model by providing that the state's guideline reflect [what] parents living in the same household in Vermont ordinarily spend on their children.⁵

⁵ See 15 V.S.A. § 654.

Besides the income shares model, there are two other guidelines models currently in use by states. The percentage-of-obligor income model is used by six states. Arguably, New York claims to rely on the income shares model, but is often classified as a percentage-of-obligor income guidelines. Delaware, Hawaii, and Montana use the Melson formula. All three guidelines models in use allow the children to share in the lifestyle enjoyed by the paying-parent when that paying-parent can afford to live a lifestyle beyond subsistence (which is often noted as a self-support reserve).⁶ In other words, no model provides for the cost of the basic needs of the child only, rather if a paying-parent has substantially more income (e.g., a net income of \$20,000 per month, the guidelines provide for amount commensurate with that income). An example, of a measurement that reflects the cost of the child's basic needs would be the federal poverty guidelines or the basic budget needs.⁷

The percentage-of-obligor income model uses the obligor's income only in the calculation of support. As a consequence, the income of the custodial parent does not affect the guidelines-determined amount. In contrast, the more income that the custodial parent has in the income shares model, the lower is the guidelines amount because the custodial parent shares more of the financial responsibility of the child. The percentage-of-obligor income guidelines is simple to use. Still, several states (e.g., Arkansas, Georgia, Illinois, New Hampshire, North Carolina, Tennessee, and Wyoming) switched from a percentage-of-obligor income model to an income shares approach in the past three decades. New York calls itself an "incomes shares" guidelines, but the calculation of base support under the New York guidelines can be calculated using a percentage of obligor income only. The incomes of both parents are only needed to calculate add-ons such as childcare expenses and the healthcare costs of the child and to determine whether the presumptive formula still applies to high income cases. Most percentage-of-obligor guidelines models also relate to expenditures on child-rearing expenditures in intact families. Many of these states explicitly or implicitly assume that the custodial parent spends an equal proportion of their income or dollar amount on the child.

The Melson formula is a hybrid of the income shares approach and the percentage-of-obligor income guidelines. Each of these states prorates a basic level of support to meet the primary needs of the child; then, if the payer-parent has any income remaining after meeting their share of the child's primary support, their basic needs, and payroll taxes, an additional percentage of their income is added to their share of the child's primary support.

There are several other guidelines models not in use that have been proposed.⁸ Each have failed for various reasons. Research finds that other factors (e.g., economic basis, whether the schedule has been

⁶ Vermont updates its self-support reserve annually. In 2023, it is \$1,458 net per month.

⁷ See Vermont Legislative Joint Fiscal Office. (Jan. 2021). *Vermont Basic Needs Budgets and Livable Wages*. Retrieved from: <https://lifo.vermont.gov/assets/Subjects/Basic-Needs-Budgets/1defd522f/2021-Basic-Needs-Budget-and-Livable-Wage-report-FINAL-1-16-2021.pdf>.

⁸ For example, see the Child Outcomes Based Model discussed by the Arizona Child Support Guidelines Review Committee, Interim Report of the Committee, Submitted to Arizona Judicial Council, Phoenix, Arizona on October 21, 2009; the American Law Institute (ALI) model can be found in the 1999 Child Support Symposium published by *Family Law Quarterly* (Spring 1999); and the Cost Shares Model can be found at Foohey, Pamela. "Child Support and (In)ability to Pay: The case for the cost shares model." (2009). *Articles by Maurer Faculty*. 1276. Retrieved from <https://www.repository.law.indiana.edu/cgi/viewcontent.cgi?article=2271&context=facpub>.

updated for changes in price levels, and adjustments for low-income parents) affect state differences in guidelines more than the guidelines model.⁹ Federal regulation does not require states to adapt a particular guidelines model or format or use a specific economic study.¹⁰

Betson-Rothbarth (BR) Estimates: Basis of the Most Guidelines Including Vermont

The current Vermont table is based on national measurements of child-rearing expenditures developed by Professor David Betson, University of Notre Dame using the Rothbarth methodology to separate the child's share of expenditures from total household expenditures. An economic methodology is necessary because the child's share of all expenditure items (e.g., electricity for the home) is not readily observable. There are five Betson-Rothbarth (BR) studies. Most states (31 states including Vermont), the District of Columbia, and Gaum base their guidelines table on a BR study.

Rothbarth Methodology

Named after the British WWII economist who derived it, the Rothbarth methodology is a marginal cost approach that compares expenditures of two sets of equally well-off households: one set consists of two-parent families with children, and the other consists of couples without children. The difference in their expenditures is presumed to be spent on child-rearing. The Rothbarth methodology relies on the percentage of total expenditures devoted to adult goods (*i.e.*, adult clothing in Betson's application) to determine equally well-off families.¹¹ For theoretical reasons, economists believe that the Rothbarth methodology understates actual child-rearing expenditures because it overstates the substitution effect from expenditures for adults to expenditures for children (*e.g.*, parents may spend less on adult clothing once they have children). Nonetheless, in Betson's original study of child-rearing expenditures that included the evaluation of five different methodologies, Betson concluded that the Rothbarth methodology was the most robust and, hence, recommended states use Rothbarth measurements as the basis of their guidelines.¹² At the time, most states (including Vermont) were using measurements of child-rearing expenditures based on another marginal cost approach (*i.e.*, the Engel estimator) that uses food shares to determine equally well-off families.¹³ At the time, economists believed that the Engel methodology overstated actual child-rearing expenditures because it understates the substitution effect because children are more food intensive. Most states switched to a Rothbarth study in the 1990s or 2000s.

⁹ Venohr, J. (Apr. 2017). Differences in State Child Support Guidelines Amounts: Guidelines Models, Economic Basis, and Other Issues. *Journal of the American Academy of Matrimonial Lawyers*.

¹⁰ The federal requirements are provided in 45 C.F.R. § 302.56, which is shown in Section 1 of this report.

¹¹ Betson has conducted sensitivity tests to determine if alternative definitions of adults good affects the measurements and found that it did not.

¹² "Robust" in statistics means good performance in statistical tests, including results that are generally unaffected by outliers or small changes in model assumptions. For more information, see Betson, David M. (1990). *Alternative Estimates of the Cost of Children from the 1980–86 Consumer Expenditure Survey*. Report to U.S. Department of Health and Human Services, Office of the Assistant Secretary for Planning and Evaluation. University of Wisconsin Institute for Research on Poverty, Madison, WI.

¹³ Specifically, most states were relying on measurements from Thomas J. Espenshade (1984). *Investing in Children: New Estimates of Parental Expenditures*, Urban Institute Press: Washington, D.C.

Studies over Time and the Basis of the Current Vermont Table

In his first study, which was commissioned by the U.S. Department of Health and Human Services to assist states with the development of child support guidelines, Betson produced Rothbarth measurements of child-rearing expenditures from expenditure data from families surveyed in 1980–86.¹⁴ He also produced estimates from four methodologies in his first report. He concluded that the Rothbarth methodology was the most robust (e.g., statistically sound and produced sensible results) and, hence, recommended its use for state child support guidelines. Since then, several states (i.e., Arizona, California, and Michigan) and the University of Wisconsin – Madison Institute for Research on Poverty have commissioned updates of the BR estimates.

The Vermont table is based on the fourth BR (also called BR4) study.¹⁵ It was the most current BR study available when Vermont last updated its guidelines. It considers expenditures data from families surveyed in 2004–2009 and was updated to 2019 price levels.

Betson just updated his Rothbarth estimates using more current expenditure data (2013–2019) in 2020. With the exception of Massachusetts (which is discussed later), all states that have updated their child support guidelines table since 2020 rely on the BR5 study. Commissioned by Arizona, the BR5 study also developed national measurements of child-rearing expenditures. As an aside, the fourth BR study (BR4) that forms the basis of the Vermont table was commissioned by California. Both Arizona and California have published sufficient information that other states can use the findings from the BR study to develop child support formulas/tables. There is no federal or periodic update of the BR or other estimates of child-rearing expenditures. The USDA used to regularly update its estimates of child-rearing expenditures, but its last report was published in 2017. It is not clear why the USDA discontinued updating its study.

Consumer Expenditure Survey (CE) and National Data

All studies of child-rearing expenditures conducted in the past three decades rely on expenditure data collected from households participating in the Consumer Expenditure Survey (CE). Conducted by the U.S. Bureau of Labor Statistics (BLS), the CE is the most comprehensive and detailed survey of household expenditures. The CE surveys households on hundreds of items. The CE surveys about 5,500 households per quarter on expenditures, income, and household characteristics (e.g., family size). Households remain in the survey for four consecutive quarters, with households rotating in and out each quarter. Households are selected to represent the entire U.S. civilian noninstitutional population. Until recently, the CE surveys are designed to be nationally representative surveys with sufficient sampling to detect

¹⁴ Betson, David M. (1990). *Alternative Estimates of the Cost of Children from the 1980–86 Consumer Expenditure Survey*. Report to U.S. Department of Health and Human Services, Office of the Assistant Secretary for Planning and Evaluation. University of Wisconsin Institute for Research on Poverty, Madison, WI.

¹⁵ Betson, David M. (2010). "Appendix A: Parental Expenditures on Children." In Judicial Council of California, *Review of Statewide Uniform Child Support Guideline*. San Francisco, CA. Retrieved from <http://www.courts.ca.gov/partners/documents/2011SRL6aGuidelineReview.pdf>.

regional differences but not state differences. In 2017, the BLS began statewide sampling for the five large states.

Most economists estimating childrearing expenditures combine data for about five years to achieve a sufficient sample size. Most of these economists also used three or four quarters of expenditures data for a surveyed family.

In short, the sampling is insufficient to produce Vermont-specific measurements of child-rearing expenditures. Also, replicating the CE at the state level would take a prohibitive amount of time and resources. Instead, states with incomes or a cost of living that are sufficiently below (above) average often adjust the BR estimates downward (upward) using income differences, rent differentials, or a state's price parity. For example, the Connecticut child support table is based on a national BR study, but adjusted upward to account for Connecticut's above average income. Still another example is Maine that is adjusted downward for Maine's slightly below average price parity. The U.S. Bureau of Economic Analysis (BEA) has developed a price parity index to compare how less (more) a region's prices are than the national average.¹⁶ The BEA's price parity sets the U.S. average at 100.0. Those with price parities below 100.0 have below national average prices and those with price parities above 100.0 have above national average prices. As of 2021, the BEA measures Vermont's price parity to be 98.7. In contrast, Connecticut's price parity is 102.6 and Maine's price parity is 97.2. The price parities of other neighboring states are 108.9 in Massachusetts, 102.5 in New Hampshire, and 109.5 in New York.

According to the 2021 U.S. Census Bureau American Community Survey (ACS),¹⁷ Vermont's median family income of husband–wife families with children under 18 years old is \$117,166 per year, while the comparable U.S. income is \$112,461. The median incomes of nearby states are \$144,991 in Connecticut, \$109,002 in Maine, \$157,418 in Massachusetts, \$138,988 in New Hampshire, and \$125,251 in New York. Also using the 2021 ACS, Vermont's median gross rent was \$1,115, while it was \$1,191 nationally. The median rents of nearby states are \$1,227 in Connecticut, \$945 in Maine, \$1,487 in Massachusetts, \$1,263 in New Hampshire, and \$1,409 in New York.

Based on these statistics, Vermont's cost of living and income is not sufficiently different from the national levels to warrant an adjustment to the national measurements of child-rearing expenditures. Vermont has not made adjustments in the past either.

Changes to the CE over Time

Like most surveys, the BLS has made several improvements to the data it captures over time. Some of these improvements may contribute to differences in study results over time. In 2004, BLS improved its income measurement to address a perceived anomaly occurring at low incomes where average expenditures exceeded average income. This improvement may have affected measurements of expenditures at low incomes for studies relying on data beginning in 2004. In 2010 and after, all

¹⁷ 2021 U.S. Census American Community Survey data retrieved from <http://data.census.gov>.

economists used “outlays,” while older studies used “expenditures.” The BLS added outlays to its dataset at about this time. Both outlays and expenditures measure the cost of economic goods and services, including the sales tax on these items. They differ in their treatment of purchases of homes, vehicles, and other items procured through installment payments. Expenditures track more closely to how gross domestic product is measured by considering home purchases to be an investment in physical capital, so expenditures consider only the payment of mortgage interest, while outlays consider payments of both mortgage interest and principal, even if it is a second mortgage or home equity loan. (To be clear, the CE also captures rents for non-homeowners and other housing expenses such as utilities and HOA fees.) Expenditures data captures the full purchase price of any vehicle purchased during the survey period, whereas outlays consider only the monthly installment payments for vehicles that are financed during the survey period. In 2013, the BLS improved how it measured taxes. This is important to using the data to form child support guidelines because most households base expenditure decisions on their after-tax income, which is the amount available for expenditures, rather than their gross income. In turn, this also affects expenditures to after-tax income ratios that are often used to convert measurements of child-rearing expenditures to child support schedules and formulas.

THE COVID-19 Pandemic and the CE

The most current studies of child-rearing expenditures consider expenditure data from 2013–2019, which is before the COVID-19 pandemic began in 2020. The pandemic has had major impacts on the economy and expenditures. The impact has changed over time and is still evolving. The initial reaction was skyrocketing unemployment and massive shifts in consumption to more home-based goods including those that engaged in remote learning. Then, as the economy began to open, there were labor shortages and a shift to travel and leisure consumption. The last couple years have witnessed record-high inflation. The ideal would be to have more current measurements of child-rearing expenditures, but the economy and consumption have never reached a steady state.

ECONOMIC BASIS OF STATE GUIDELINES AND NEW STUDIES OF CHILD-REARING EXPENDITURES

Studies of child-rearing expenditures vary in the methodology used to separate the child’s share of total expenditures and the age of the expenditure data. Exhibit 3 compares the findings from studies conducted in the last five years and those underlying state guidelines. The studies vary in methodologies used to separate child-rearing expenditures and age of the underlying data.

Exhibit 3: Comparison of Findings from Recent Studies of Child-Rearing Expenditures and Studies Underlying State Guidelines¹⁸

Economic Methodology	Economist and Data Years	Average Child-Rearing Expenditures as a Percentage of Total Expenditures		
		1 Child	2 Children	3 Children

Only four new studies have been conducted since Vermont last reviewed its child support guidelines. The new studies include the BR5 study conducted in 2020 for Arizona that has already been discussed, a study by Florida State University economists,²⁹ and two other studies conducted by Betson using alternative methodologies.

Exhibit 3 shows the average percentages for one, two, and three children. Most economists limit their estimates to these family sizes because there are few families with four or more children in the Consumer Expenditure Survey (CE), which is the source of expenditures data for the studies shown except the van der Gaag study, which was a literature review conducted in 1981.

Exhibit 3 shows child-rearing expenditures as an average percentage of total expenditures, which is how most researchers report their findings. The difference between expenditures and gross income generally covers taxes, savings, and gifts and charitable contributions outside the home. A notable exception is the van der Gaag (1981) study, where his estimates relate to income, but he does not specify whether income is gross or net. The USDA study relates to gross income, but also reports its estimates as percentages of total expenditures in order to compare them to the results from other studies.

Studies underlying State Guidelines

In all, there are 11 different measurements of child-rearing expenditures that form the basis of state guidelines. Exhibit 3 shows all but the economic study underlying the Kansas child support guidelines.³⁰ The Kansas study does not report child-rearing expenditures in the same format as shown in Exhibit 3. It is also not relevant to Vermont's current review because its per capita methodology is a unique approach and differs from a study of expenditures on children among parents living together, it an old study, and Kansas is the only state to rely on it.³¹

³¹ *Ibid.*

The studies are typically done by academicians or federal government researchers and then converted for use for state guidelines by another economist. Five of the studies in use are BR measurements (32 states). The second and third most used studies date back to the 1980s (11 states). The van der Gaag study was published in 1981 and the Espenshade study was published in 1984. Based on 1972–72 CE data, the Espenshade study was the basis of the prototype income shares model developed through the 1983–87 National Child Support Guidelines Project.³² Like the Rothbarth methodology, the Engel methodology compares two sets of equally well-off couples: those with and those without children. The difference between the Rothbarth methodology and the Engel methodology is that the Rothbarth methodology uses expenditures on adult goods (i.e., adult clothing in Betson's estimates but other applications of the Rothbarth methodology also use alcohol and tobacco) and the Engel methodology uses food shares. Most states that rely on the van der Gaag or Espenshade study have never updated their guidelines formula/table, and many are based on a percentage-of-obligor income guidelines model. The van der Gaag study was conducted by a University of Wisconsin professor for Wisconsin when Wisconsin was developing its guidelines. Several states adapted the Wisconsin formula.

Besides the Rothbarth studies and the older studies, there are two states that rely on the most recent U.S. Department of Agriculture (USDA) study, which is from 2017. It is the only study used by Minnesota, but Minnesota significantly adjusted the USDA results for the low-income part of its table. Maryland also relies on the USDA study for its table amounts at high incomes and relies on BR4 for combined parental incomes below \$10,000 gross per month. The USDA study attempts to measure child-rearing expenditures for seven items (i.e., housing, transportation, food, clothing, healthcare, childcare and education, and miscellaneous expenses). It succeeds for some items. For example, it uses USDA food budgets to estimate the child's food cost. Still, an economic estimation methodology was still needed to separate housing expenses between children and adults in the USDA estimates. The USDA study was discussed in the 2019 Vermont child support guidelines review report.

New Jersey uses a Rothbarth study that has been adjusted for New Jersey's income,³³ which are significantly above national average. Due to the adjustment for New Jersey income and because it is an older study, it also is not appropriate for Vermont. Georgia uses the average of the BR2 study and an Engel study conducted by Betson.

The three states using the Melson formula generally rely on the federal poverty guidelines as the basis of primary support, but the economic basis of the percentage of the paying-parent's income above that is unknown.³⁴ There are also three other states (i.e., Massachusetts, North Dakota,³⁵ and Utah) where

the economic basis of their child support table is not clear or there is not one. Rather than basing its table on economic data, Massachusetts considered “a range of legal, policy and practical considerations” when recommending changes to its table. Source.³⁶ The Massachusetts is generally a high child support guidelines.³⁷

Lewin Study for the U.S. Department of Health and Human Services

Through a contract with the U.S. Department of Health and Human Services, Lewin/ICF (1990)³⁸ assessed the various economic methodologies. One finding was that economists do not agree on which methodology best measures actual child-rearing expenditures. To this end, Lewin/ICF recommended that instead of relying on one measurement, it was appropriate for states to compare their guidelines amounts to the lowest and the highest credible measurements of child-rearing expenditures. If the state’s guidelines amounts were below the lowest of the credible measurements, the state’s guidelines amounts may be inadequate. Historically, the Rothbarth estimator has been used as the lower bound because it is known to underestimate actual child-rearing expenditures due to the substitution effect between expenditures on children and adult clothing.³⁹ If there was no substitution, there would be no downward bias.

Recent Studies of Child-Rearing Expenditures

Since Vermont last reviewed its child support guidelines in 2019, there has been four new studies of child-rearing expenditures. The most current Betson-Rothbarth (BR5) study clearly emerges as the study most appropriate for Vermont if Vermont decides to update its table for a more current study.

BR5 Study

The BR5 study is conducted by the same economist who developed the economic study underlying the current Vermont guidelines table, uses the same methodology, and uses same data and methodological assumptions. The only difference is that it uses more current CE data. As shown in Exhibit 3, there are small increases from the BR4 to BR5. Yet, the actual amounts vary by income. Exhibit 4, Exhibit 5, and Exhibit 6 compares the BR4 and BR5 measurements over a range of net incomes for one, two, and three children. This is before they are adjusted to exclude childcare expenses and all but the child(ren)’s ordinary medical expenses. Adjustments for these factors, which is a step in preparing an updated guidelines table, further lower the estimates but not by the same amount across all income ranges or number of children because these expenses vary by income and number of children.

Exhibit 4: Comparison of BR4 and BR5 as a Percentage of the Combined Net Income of the Parents: One Child

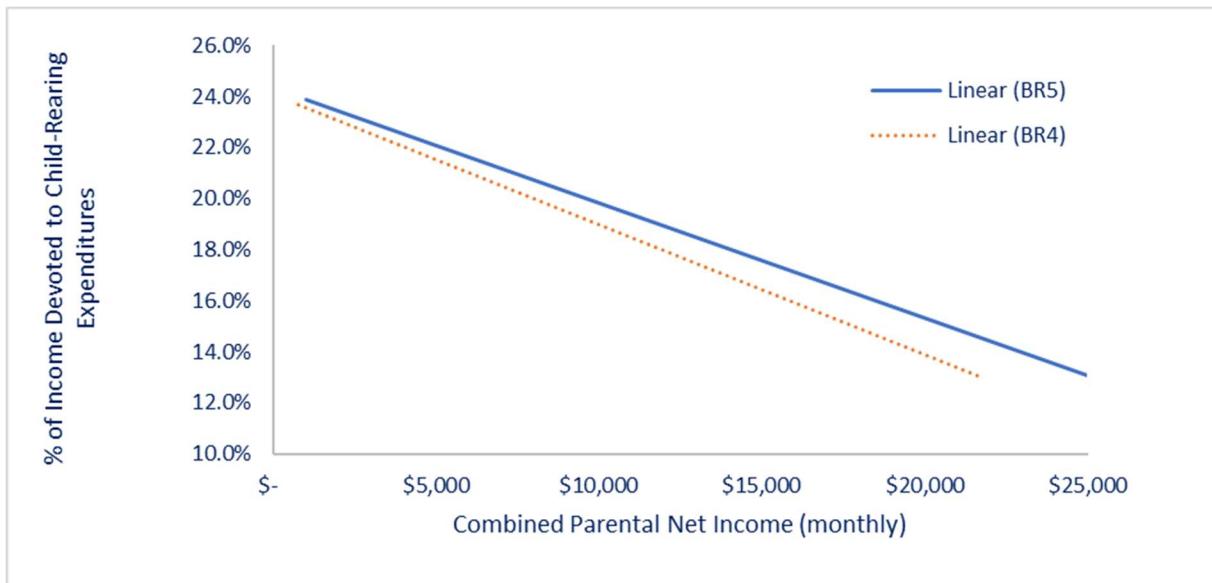

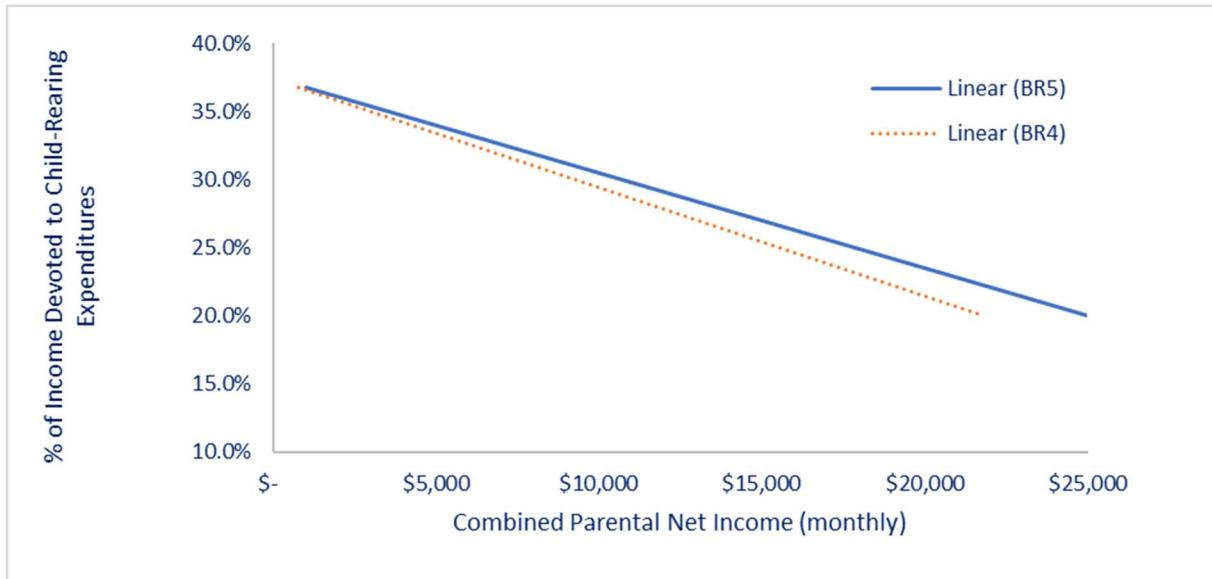

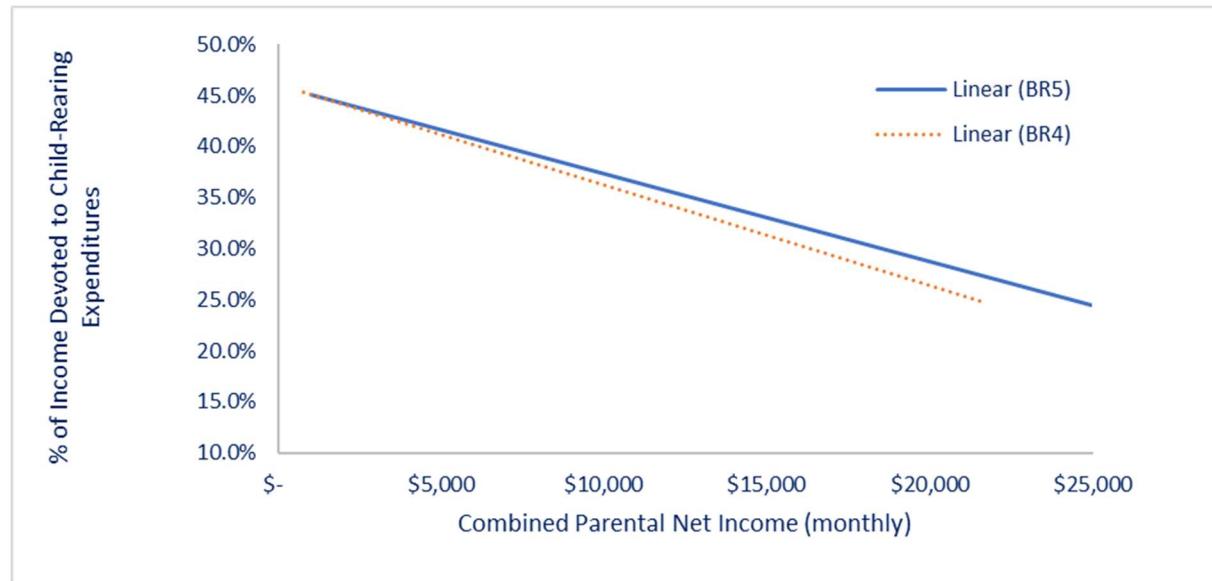

Exhibit 5: Comparison of BR4 and BR5 as a Percentage of the Combined Net Income of the Parents: Two Children

The BR5 estimates form the basis of nine state guidelines including neighboring Maine. For Betson's 2020 study, he developed estimates of child-rearing expenditures using a "baseline" based on the same assumptions he had used for his earlier studies, which is expenditures among husband-wife families of child-rearing age who have no other adults (including adult children) living in their household. He also explored three modifications to this baseline: the first included households with older children; the second included married couples with domestic partners; and third alternative considered quarterly wage data rather than annualized data. In general, Betson found few differences in the results from these alternatives than the results from his baseline set of measurements. Betson found that estimated child-rearing expenditures when including domestic partners never exceeded 0.9% of the baseline

estimates; that including families with adult children living in the household produced lower estimates than the baseline but was a small share of families; and that using quarterly data produced higher estimates than the baseline but that expenditures averaged over the year may be a more appropriate reflection of expenditures.

Exhibit 6: Comparison of BR4 and BR5 as a Percentage of the Combined Net Income of the Parents: Three Children

Florida Study

The Florida researchers estimated child-rearing expenditures using both the Engel and Rothbarth approach. They reported their estimates as a percentage of consumption (total household expenditures) for five quintiles of income. Using the Engel methodology, the estimates ranged from 19.2–21.9% for one child, 30.9–35.1% for two children, and 39.0–44.1% for three children. Using the Rothbarth methodology, they ranged from 24.5–25.2% for one child, 37.7–38.8% for two children, and 46.2–47.4% for three children. For the Engel methodology, the percentages were highest at the lowest quintile of income and their lowest at the highest quintile of income. For the Rothbarth measurements, the converse was true. The Florida researchers also made a slight modification to their Engel and Rothbarth estimating equations to examine the impact of a variable indicating whether an examined household was from Florida. They found a slight increase.

Other Betson Studies

In the last few years, Betson has conducted two alternative studies using different economic estimation methodologies. For California (2021), Betson attempted to measure child-rearing expenditures directly using an approach similar to the USDA. (The Rothbarth and Engel approaches are considered indirect approaches because they compare expenditures between equally well-off families with and without children and attribute the difference to expenditures on child rearing.) For both of these alternative studies, Betson estimated child-rearing expenditures from 2013–2019 CE.

Betson's Attempt to Directly Measure Child-Rearing Expenditures

For the direct methodology, Betson initially planned to replicate the USDA approach that measures child-rearing expenditures for seven categories of expenditures (e.g., the child's housing, food, and transportation). He abandoned this approach because of insufficient documentation to replicate how the USDA arrived at the child's share of housing and medical expenses. Still, Betson was able to use approaches similar to the USDA's to estimate the child's food costs, transportation costs, clothing, childcare, and miscellaneous expenses.

To arrive at the child's housing expenses, he used two different approaches. For one, he followed the current concept of the USDA approach, which is to base it on the cost of an additional bedroom. For the other, he relied on the old USDA approach that uses a per capita approach to estimate the child's share of housing expenses. To arrive at the child's out-of-pocket medical expenses, he also relied on Medical Expenditure Panel Survey data, as does the USDA. His estimates varied significantly depending on how he measured housing. When he used the cost of an additional bedroom, he estimated that percentage of total expenditures allocated to children were 22.5% for one child, 35.6% for two children, and 45.7% for three or more children. When he used the per capita approach, he estimated that percentage of total expenditures allocated to children were 28.8% for one child, 43.7% for two children, and 54.8% for three or more children. The different results highlight how sensitive the overall estimate is to how the child's housing expenses are estimated. Housing expenses constitute the largest share of the total household budget. Betson suggests that the true value may be somewhere nearer the average of the two estimates: 25.7% for one child, 39.7% for two children, and 50.3% for three or more children.

Besides changes over time and differences in how housing and medical expenses were measured, Betson's direct measurement approach differed in other ways from the USDA approach. The USDA relies on quarterly data rather than annualized data, and quarterly data is known to produce larger estimates. The USDA restricts its measurements for individual expenses to those with nonzero amounts. For example, the USDA measurement of childcare and education includes only families that have some childcare and education expenses.

Betson-Engel Estimates

Since Georgia is based on the average of the second Betson-Rothbarth study (BR2) and Engel estimates he produced for the same study from the same CE data years, Georgia commissioned Betson to update his Engel estimates using 2013–2019 CE data. (Betson had updated his Rothbarth estimates using 2013–2019 data for Arizona.)

The Georgia report compares the Betson results to the Florida State results. It finds similarities between the Betson-Engel amounts and earlier Florida-Engel amounts. It also notes the latest Engel estimates are significantly less than previous Betson-Engel estimates and that there are several nuanced difference between how Betson and the Florida researchers structure their estimating equations.

Explaining the drop in the Engel estimates was a major concern to Betson. He explored whether the drop reflected an actual decrease in child-rearing expenditures or a data/estimation issue. After examining 35 years of CE data, he noticed that the Engel estimates had been decreasing over time as well as a major decrease beginning in 1988. The 1988 decrease coincides with a change in how the CE survey respondents about food consumption. This is a data issue. The second reason concerns the

downward trend of the estimated Engel over time. This appears to be a methodological issue. Food consumption appears to become more discretionary over time rather than a necessity—that is, consumers can vary the food items they consume as family size and budgets change rather than be stuck with the same food items. When food is purely a necessity, the amount needed to compensate a childless couple for the additional cost of children can be anchored by the percentage spent of necessary food. To retain that percentage, one could simply increase that childless couple's income by how much it costs to raise the children. However, when food consumption becomes more discretionary, there is substitution within the types of food purchased when there are children. These substitution effects are exacerbated by the substitution of food and other items (e.g., expenditures on adults goods and housing) particularly when some of those other items must also be consumed for the child (e.g., housing). (In contrast, expenditures on adult goods—which is the proxy of equally well-off families using by the Rothbarth methodology—does not contain the same issue because adults goods are consumed by just the two adults in the household regardless of the family size.)

SUMMARY

Most state guidelines (including the Vermont guidelines table) relate to a study of child-rearing expenditures. There are 11 studies of child-rearing expenditures forming the basis of state guidelines. They vary in the age of the underlying expenditure data and the methodology used to separate the child's share of expenditures from total household expenditures. Economists generally do not agree which economic methodology best measures child-rearing expenditures, but most agree that amounts between the lowest and highest of credible estimates of child-rearing expenditures are appropriate.

Most states (including Vermont) rely on an economic study of child-rearing expenditures conducted by Professor Emeritus David Betson, University of Notre Dame, using the Rothbarth methodology to separate the child's share of expenditures from total expenditures. Most conventional economists believe that the Rothbarth methodology understates actual child-rearing expenditures. Regardless, after reviewing several other methodologies, Betson recommends use of the Rothbarth estimator for state child support guidelines.

Betson developed his first estimates of child-rearing expenditures using the Rothbarth methodology in 1990 and has subsequently updated his study four times. The current Vermont guidelines table is based on his fourth study. Since Vermont last reviewed its guidelines, Betson has updated his study again. His latest study (known as BR5 because it is the fifth Betson-Rothbarth study) was released in 2020 and forms the basis of nine state guidelines including Maine, which neighbors Vermont.

Besides the Betson-Rothbarth estimates, about a dozen states use measurements of child-rearing expenditures from two studies dating back to the 1980s, two states use the USDA study, New Jersey uses its own Rothbarth study that was adjusted for New Jersey's above average income, and Kansas uses a unique approach that was developed by Kansas professors several decades ago.

Besides the latest Betson-Rothbarth study released in 2020, there have been three other studies of child-rearing expenditures. One was conducted by Florida State University researchers; the other two

were conducted by Betson using alternative methodologies. Neither of these alternative estimates or the Florida estimates form the basis of any state's guidelines. Betson still believes that the Rothbarth estimator is the best approach for measuring child-rearing expenditures.

SECTION 3: ASSUMPTIONS AND STEPS USED TO DEVELOP UPDATED TABLES

This section documents the assumptions and steps used to develop updated Tables. The updated Table of Intact Family Expenditures on Children is provided in Appendix A. The updated Adjusted Gross to After Tax Income Conversion Table for Sole or Split Custody is provided in Appendix B. The updated Adjusted Gross to After Tax Income Conversion Table for Shared Custody is provided in Appendix C.

SUMMARY OF DATA SOURCES AND KEY ASSUMPTIONS

- The existing and updated Expenditure Tables are both based on the income shares model, which seeks to apportion to the child the amount the parents would have spent if the parents and children lived in the same household and the parents shared financial resources.
- The measurements of child-rearing expenditures underlying the existing and updated Guideline Tables are based on the Betson-Rothbarth (BR) estimates of child-rearing expenditures. The existing Guideline Table is based on the fourth BR study that relied on expenditure data collected from families surveyed in 2004–2009. The fifth BR study that relied on expenditure data collected from families surveyed in 2013–2019 forms the basis of the proposed Guideline Table.
- The updated Guideline Table is based on April 2023 price levels.
- The existing and updated Guideline Tables reflect average child-rearing expenditures from ages 0 through 17 years old.
- The existing and updated Guideline Tables excludes parental expenditures for childcare and the child's share of health insurance premiums and extraordinary, out-of-pocket medical expenses incurred for the children. The schedule includes ordinary, out-of-pocket medical expenses of \$250 per child per year.⁴⁰ Even healthy children are likely to incur some medical expenses over the course of the year, such as medication, cough syrup, or co-pays. Vermont guidelines provide that the actual amount spent for childcare, the child's health insurance, and the child's extraordinary medical expenses be considered on a case-by-case basis in the calculation of support.
- Both the existing and updated Guideline Tables has been extended to monthly combined available incomes of \$30,000. The economic data on child-rearing expenditures only considers incomes to about \$17,000 (under the existing Guideline Table) and about \$27,000 (under the updated Guideline Table). Both tables were extended to \$30,000 net by estimating a trend line for child-rearing expenditures based on net income, then extending that trend line to \$30,000.

⁴⁰ Based on the current data year, the 2015 Medical Expenditure Panel Survey (MEPS) finds that the average out-of-pocket medical expense per child was \$248 per year, but varied depending on whether the child was enrolled in public insurance such as Medicaid or had private insurance. (Source: Calculated from the U.S. Department of Health and Human Services 2015 Medical Expenditure Panel Survey. Retrieved from https://meps.ahq.gov/mepsweb/about_meps/survey_back.jsp.)

- The updated tax conversion tables consider 2023 federal and state income taxes and FICA.⁴¹

The major change since the last review is inflation. Price levels have increased 19.3% since the existing Guideline Table was developed. Most of the changes to the tax conversion tables are due to IRS inflationary changes to income brackets.

ASSUMPTIONS AND STEPS USED TO DEVELOP THE UPDATED GUIDELINE TABLE

Assumptions

Child support guidelines are part policy and part economic data. One of the major policy decisions is the child support guidelines model. It dictates what type of measurements of child-rearing expenditures to use. Vermont Statute (15 V.S.A. § 654) requires that the Vermont guidelines reflect what parents living in the same household ordinarily spend on their children. The Income Shares model, which was discussed in the previous chapter, fits this requirement. It necessitates the use of measurements of expenditures of intact families.

Another assumption is that the guidelines table should consider combined parental incomes through \$30,000 net per month. The previous BR study (i.e., BR4) could only measure child-rearing expenditures among families with up to a combined income of \$17,652 net per month because there is an insufficient number of families with higher incomes in the CE. Since incomes have generally increased over time, the BR5 can measure child-rearing expenditures for combined incomes up to \$25,526 net per month. Above that income through \$30,000 net per month, a formula was estimated from the percentages at lower income and applied to arrive at amounts for incomes between \$25,526 and \$30,000 net per month. This is generally the same methodology used for the existing guidelines table.

Steps

Step 1: Convert to current price levels

Betson developed his estimates based on May 2020 price levels. They are updated to April 2023 price levels using changes in the Consumer Price Index developed by the U.S. Bureau of Labor Statistics.

Step 2: Subtract selected expenses

The studies measuring child-rearing expenditures include all expenditures on the children, including work-related childcare expenses, the cost of the child's health insurance benefit, and the child's uninsured medical expenses. In contrast, most income shares guidelines, including the existing Vermont guidelines, consider the actual amount of these expenses on a case-by-case basis when calculating the support award. Since the actual amounts are considered, they are not included in the Guideline Table. Including them in both the Guideline Table and worksheet would result in double-accounting of those expenses.

⁴¹ There is an exception for the federal earned income tax credit because the 2019 formula has not been made available yet. Instead, the 2018 formula is used.

Betson provided supplemental information in order to subtract these expenses from his total estimates of child-rearing expenditures for the purposes of developing a Guideline Table. (This information is provided in Appendix D as well as more information about the Consumer Expenditure Survey—CES, which is a data set Betson uses to develop his measurements.) Using the same subset of the CES that he used to measure child-rearing expenditures, Betson measured the percentage of total expenditures devoted to childcare expenses; the percentage of total expenditures devoted to out-of-pocket healthcare expenses, including the cost of the child's health insurance benefits; and expenditures to net income ratios.

An additional assumption is needed to capture the child's share of the household's out-of-pocket healthcare expenses. The underlying economic data on expenditures does not attribute out-of-pocket healthcare expenses to the children. Instead, they are reported for the entire family. An assumption must be made about the child's share in the development of the Guideline Table. For the existing and proposed Guideline Table, the child's share is estimated by applying the percentage of total expenditures to the family's total out-of-pocket medical expenses exceeding \$250 per person per year.

Step 3: Extend the estimates to four and more children

Betson's estimates only cover one, two, and three children, yet the Guideline Table covers up to six children. The number of families in the CES with four or more children is insufficient to produce reliable estimates. For both the existing and updated Guideline Table, the National Research Council (NRC)'s equivalence scale, as shown below, is used to extend the three-child estimate to four and more children.⁴²

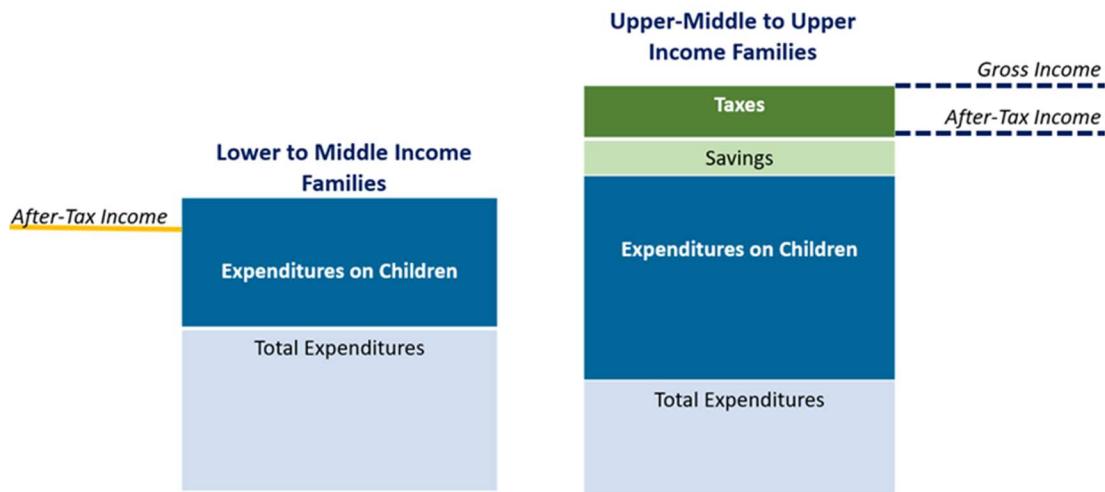

$$= (\text{Number of adults} + 0.7 \times \text{number of children})^{0.7}$$

Step 4: Back out estimates to net income

The Betson-Rothbarth (BR) estimates of child-rearing expenditures are expressed as a percentage of total family expenditures. Some families have savings and do not spend all of their after-tax income on their family. See Exhibit 7 for an illustration that compares expenditures between low-families that spend more than their after-tax income on average and upper-middle to upper income families who do not spend all of their after-tax income on average and generally have savings. Most income shares tables, including the existing Vermont table, consider the expenditures to consumption ratios observed among the same sample of families in the CE used to calculate child-rearing expenditures. These ratios (which are also provided in Appendix D) are multiplied by the BR measurements to arrive at a percentage of total family after-tax income expended on children. For income ranges of families where the average expenditures to after-tax income is greater than one, the ratio is capped at one. This occurs at the lower income ranges. Setting at more than one would have the policy implication that parents should spend more than their income.

⁴² Citro, Constance F. & Robert T. Michael (eds.). (1995). *Measuring Poverty: A New Approach*. National Academy Press. Washington, D.C.

Exhibit 7: Relationship between Expenditures and Income

Step 5: Calculate marginal percentages

The application of the previous steps yields percentages of net income attributable to child-rearing expenditures for one to six children that do not include childcare expenses, health insurance premiums, or uninsured, extraordinary medical expenses for several income ranges. To gradually phase between income ranges, most income shares guidelines use marginal percentages that are developed by taking the ratio of (a) the difference in the base support amount between one income bracket and the next bracket and (b) the difference in the monthly net income between the same income brackets. In turn, basic obligations are calculated by applying the percentage of net income attributable to child-rearing expenditures to the midpoint of each income range.

Step 6: Extrapolate estimates to higher incomes

The BR5 measurements are available for combined incomes up to about \$25,526 net per month. Above this level, there is insufficient information to know how the percentage of income devoted to child-rearing expenditures changes as income increases. For example, it is unknown whether those with combined incomes of \$25,000 net per month devote the same percentage of income to child-rearing expenditures as those with \$35,000 net per month.

A similar issue existed in the development of the existing guidelines table. For that table, an extrapolation formula based on logged income to the third degree was developed from the BR percentages at lower incomes and applied to higher incomes to develop table amounts at higher incomes. The same approach was used for the updated table amounts for one and two children. However, this formula produced anomalous results for three children. Due to this, the ratio of expenditures for three children and two children was used instead of child-rearing expenditures for three children in the regression equation (which is how the extrapolation formula was developed). In turn, the estimating equation was used to populate the guidelines table amounts for three children above \$25,500 through \$30,000. For four and more children, the equivalence scale in Step 3 was applied.

UPDATED TAX CONVERSION TABLES

Overview of Federal and State Changes Since Last Guidelines Review (2019)

Unlike the last review, there were no statutory changes to federal tax rates that are still effective in 2023. Congress did increase the child tax credit in 2020 and 2021 to combat the economic downturn caused by the COVID-19 pandemic, but they are no longer in effect. Since 2019, the only changes that are still in effect are inflationary changes to the income brackets, monthly allowances, and Earned Income Tax Credit (EITC).

There were also small inflationary changes to the state income tax brackets and withholding allowance and slight increase in the State Earned Income Tax Credit (i.e., from 36–38%).

Tax Assumptions and Information Sources

Taxable Income

Each parent's taxable income is based on the standard deduction and number of exemptions prescribed in Vermont statute (15 V.S.A. § 653). Although state statute mentions exemptions, federal tax code no longer eliminates the personal exemption for minor children. The standard deduction amounts are provided on IRS 2023 Form 1040-ES, which is estimated taxes for individuals.⁴³ For the income conversion table for sole and split custody, it is assumed that the custodial parent files as a head-of-household and the obligated parent files as a single person. For the shared-custody income conversion table, it is assumed that each parent is a head-of-household.

Based on the 2023 Vermont W-4 that provides a formula for withholding, a single taxpayer files one withholding allowance and a head-of-household files two withholding allowances.⁴⁴ There are no additional withholding allowances for children.

Federal and State Tax Rates

The IRS publishes 2023 federal tax rate schedules as part of the IRS Form 1040-ES. They are applied to taxable income as determined above. Similarly, 2023 state tax rate schedules published by the Vermont Department of Taxes (i.e., the 2023 Vermont Withholding Tables: Effective Date: January 1, 2023) are applied to taxable income as determined above.⁴⁵

FICA

FICA consists of a 6.2% social security tax and a 1.45% Medicare tax. The employee tax rate for social security of 6.2% is applied to gross incomes of up to \$160,200 per year. The wage base limit is published

⁴³ Retrieved from <https://www.irs.gov/pub/irs-pdf/f1040es.pdf>.

⁴⁴ Retrieved from <https://tax.vermont.gov/sites/tax/files/documents/W-4VT.pdf>.

⁴⁵ Retrieved from <https://tax.vermont.gov/sites/tax/files/documents/GB-1210-2023.pdf>.

in IRS Publication 15 (Circular E), Employer's Tax Guide for 2023.⁴⁶ In addition, the Medicare tax of 1.45% is applied. There is also a 0.9% additional Medicare tax for wages in excess of \$200,000 per year. There is no wage base limit on the Medicare tax.

Child Tax Credit and EIC

Because the child tax credit and EIC are not advanced, they are computed from the IRS 2022 1040 Instructions.⁴⁷ The child tax credit is calculated on Line 19 on IRS form 1040 using Schedule 8812. The maximum child tax credit is \$2,000 per child. The formula phases out at very high incomes (*i.e.*, \$200,000 per year). For low incomes, the custodial parent may be eligible for the "additional child tax credit" since the tax liability at low-incomes may be zero or nominal.

The EIC includes a no-child EIC for qualifying noncustodial parents. The Vermont Earned Income Credit of 38% of the federal EIC is also applied. In the tax conversion tables for sole custody, the custodial parent receives the child tax credit and EIC for the number of children for whom support is being determined. The noncustodial parent receives the childless EIC.

The tax conversion tables for shared custody are somewhat more complicated because IRS rules preclude the splitting of the EIC but allowed divorced or separated parents to split the child exemptions. As a consequence, the tax conversion tables for shared custody consider the entire EITC for the number of children for whom support is being determined and the child tax credit for only half of the number of children for whom support is being determined. For example, the tax conversion tables under shared custody for two children would consider the EITC for two children but the child tax credit for only one child. Parents may split the child exemption in half (*e.g.*, there are two children and each parent may claim one) or parents may rotate from year to year (*e.g.*, there is one child and one parent claims the child in 2023 and the other parent claims the child in 2024). IRS rules provide that the custodial parent claims the child unless there is a written declaration (such as in the divorce decree) or IRS Form 8332 is used to release a claim to an exemption for a child to the parent not residing with the child.⁴⁸ This release does not apply to the EITC.

SECTION 4: COMPARISONS AND CONSIDERATION OF LABOR MARKET DATA

This section considers the impact of updating the tables by comparing the existing guidelines calculation to that using the proposed tables as well as comparisons using the USDA and Rodgers-Rothbarth measurements and the guidelines amounts of neighboring states.

Side-by-side comparisons of the existing and updated Guideline Table, Income Conversion Table for Sole and Split Custody, and Income Conversion Table for Shared Custody are provided in Appendix E, F, and G, respectively.

This section also fulfills the federal requirement to consider labor market data.

ANALYSIS OF LABOR MARKET DATA

Federal regulation (C.F.R. § 302.56(h)(1)) requires the consideration of:

... labor market data (such as unemployment rates, employment rates, hours worked, and earnings) by occupation and skill-level for the State and local job markets, the impact of guidelines policies and amounts on custodial and noncustodial parents who have family incomes below 200 percent of the Federal poverty level, and factors that influence employment rates among noncustodial parents and compliance with child support orders

This section generally uses data from the Vermont Department of Labor (VDOL),⁴⁹ unless otherwise noted. VDOL also publish many statistics that could be useful when income imputation is authorized since they report the number of jobs and average wages for specific occupations across the state and variations by county and region. Besides the requirement to analyze labor market data, other federal regulations that were added in 2016 require state guidelines to provide for the consideration of the specific circumstances of the paying-parent (e.g., the parent's barriers to employment and local employment opportunities available to the parent) when imputing income. Vermont labor market data from the U.S. Census American Community Survey⁵⁰ is the source of information for case scenarios used in the comparisons.

Unemployment and Employment Rates

When this report was prepared, April 2023 was the date of the most currently published unemployment rates. The Vermont unemployment rate was 2.4% while the U.S. unemployment rate was 3.4%. The unemployment rate was 2.5% or less for 16 Vermont's labor market areas; the only labor market area with an unemployment rate above 2.5% was Derby.⁵¹ Derby's unemployment rate was 4.0%.

Like the nation and the world, unemployment rates drastically changed as the COVID pandemic began Spring 2020 and evolved. Vermont reached record-breaking unemployment rate in April 2020, with an

⁴⁹ Retrieved from <http://www.vtlmi.info/>.

⁵⁰ See <http://data.census.gov>.

⁵¹ Local unemployment rates are not seasonally adjusted.

unemployment rate of 14.0%. Vermont's unemployment rate had declined to 4.4% by the end of 2020 and has generally declined since with a few bumps upward particularly in 2022.

These unemployment statistics rely on the U-3 measurement methodology, which is what is typically reported in media streams. The U-3 measurement includes "all jobless persons who are available to take a job and have actively sought work in the past four weeks."⁵² It is measured as a percentage of those in the civilian labor force, which includes employed and unemployed individuals.⁵³ To be employed: a person must have worked at least one hour as a paid employee or self-employed or been temporarily absent from their job or business or met other criteria. Actively seeking work means contacting an employer about a job opportunity, submitting a job application or résumé, using an employment service, or a similar activity in the last four weeks. Persons not in the labor force may not want a job, are not currently available for work, or available for work but have not looked in the last four weeks and may be "discouraged worker" (i.e., do not believe a job exists).

The U.S. Bureau of Labor Statistics has developed alternative measures that better reflect all persons who are unemployed including those who are marginally attached workers (those who want to work but are discouraged and not looking) and workers employed part-time but who would work full-time if they could. Vermont's unemployment rate using this alternative measure, which is called the U-6, was 4.6% on average for the last quarter of 2022 through the first quarter of 2023, whereas the comparable U.S. rate over the same time period was 6.8%.⁵⁴

As of April 2023, Vermont had a civilian labor force of 346,407, of which 338,096 workers were employed. The three industries with the most employment were education and health services (about 63,000 workers); government (about 55,000 workers); and trade, transportation and utilities (about 53,000 workers). When the pandemic began in April 2020, Vermont had a labor force of 350,944 workers. That labor force shrunk to 321,060 workers by October 2020. A VDOL publication on the economic impact of the pandemic states that the pandemic has a more significant impact on employment of females than males and on workers with lower levels of educational attainment. It also suggested that changes in job-search requirement for unemployment insurance contributed to the decrease in Vermont's labor force. Regardless, Vermont's labor market appears to have rebounded from the economic impact of the pandemic.

Hours Worked and Income Imputation

Hours worked has been used to inform income imputation policies. Several states have used average hours worked in their state for income imputation rather than a 40-hour workweek. In 2022, the

average workweek of Vermont employees on private nonfarm payrolls was 33.4 hours.⁵⁵ However, it varies by industry. For example, national data from May 2023 finds that the average is 34.3 hours per week for all total private employees nationally, 30.0 hours per week for those in the retail trade, and 25.4 hours per week for those in the leisure and hospitality industry.⁵⁶ Average hours worked by industry is not available for Vermont. Generally, lower-paying jobs often offer less than 40-hour workweeks.

Factors Affecting Full-Time, Year-Round Work among Low-Wage Earners

Besides less than a 40-hour workweek, several other factors contribute to the lack of full-time, year-round work. Some pertain to the employability of a parent, while others pertain to the structure of low-wage employment. A national study found that the highest educational attainment of 60% of the low-income, nonresident parents was a high school degree or less.⁵⁷ Nonresident parents also face other barriers to employment. A multisite national evaluation of nonresident parents in a work demonstration program provides some insights on this.⁵⁸ It found that 64% of program participants had at least one employment barrier that made it difficult to find or keep a job. Common employment barriers consisted of problems getting to work (30%), criminal records (30%), and lack of a steady place to live (20%). Other employment barriers noted not having the skills sought by employers, taking care of other family members, health issues, and alcohol or drug problems. Many of the participants also cited mental health issues, but few noted it as being a major barrier to employment.

Low-wage jobs do not always provide consistent hours week to week or an opportunity to work every week of the year. This causes unpredictable and erratic income, which can affect child support compliance that is typically monitored monthly basis with automatic enforcement mechanisms (e.g., driver's license suspension) generally being initiated within one to three months after becoming delinquent.⁵⁹

Over half (58%) of national workers are paid hourly.⁶⁰ As mentioned previously, the usual weekly hours are considerably less in some industries (e.g., leisure and hospitality). A Brookings Institute study defines vulnerable workers as those earning less than median earnings and having no healthcare

benefits.⁶¹ Most vulnerable workers are concentrated in the hospitality, retail, and healthcare sectors. There is considerable turnover in some of these industries. For example, the leisure and hospitality industry has an annual quit rate of 55.4% and a 21.5% annual rate of layoffs and discharges.⁶² High levels of turnover contribute to periods of non-work that can depress earnings.

The lack of healthcare benefits also contributes to fewer hours, fewer weeks worked, and voluntary and involuntary employment separations. Only one-third of workers in the lowest 10th percentile of wages have access to paid sick time, compared to 78% among all civilian workers.⁶³ For those with access to paid sick time, the average is eight days per year. Similarly, those in the lowest 10th percentile of wages are less likely to have access to paid vacation time: 40% have access, compared to 76% of all workers. Those with paid vacation time have an average of 11 days per year. Without paid sick or vacation time, a worker may terminate employment voluntarily or be involuntarily terminated when the worker needs to take time off due to an illness or to attend to personal matters. If a parent without access to paid sick and vacation time did not work for 19 days (which is the sum of the average number of paid sick days and paid vacation days), they would miss about four weeks of work throughout the year.

Another indicator of the economic challenges of low-wage parents is the percentage of households that cannot cover a \$400 emergency expense. A Federal Reserve survey finds that 36% of households could not cover a \$400 emergency expense in 2020.⁶⁴ Although the Federal Reserve survey does not specifically address child support debt and considers all households and not just those where a household members owes child support, it is a salient finding when considering low-income obligated parents in a vulnerable labor market where automated child support enforcement actions (e.g., driver's license and professional license suspension) are triggered when child support is 30 days past due. The \$400 level in the Federal Reserve study is less than some child support orders.

Low-Skilled Jobs and Employment Opportunities

In 2023, Vermont's minimum wage is \$13.18 per hour. Based on VDOL projections for 2024–2030, many of the occupations with the most job openings require few skills. The top four occupations based on the number of job openings are cashiers, retail salespersons, fast-food and counter workers, and home health and personal care aides. The fifth occupation with the most frequent job openings is general and operations managers. This may be a more skilled occupation. The next five, however, require fewer skills: waiters and waitresses, janitors and cleaners, stockers and order filers, landscaping and groundskeeping workers, and maids and housekeeping cleaners. Most of these occupations have

median pay near or just above the state minimum wage. For example, the 2022 median hourly wage for cashiers was \$13.77 per hour, \$16.94 for waiters and waitresses, \$14.54 for fast-food and counter workers, \$16.65 for janitors and cleaners, and \$15.74 for stockers and order filers.

Factors that Influence Employment Rates and Compliance

Federal regulation requires the consideration of factors that influence employment rates and compliance. There is some older academic research that finds child support can affect employment among obligated parents.⁶⁵ Another study finds some weak association of changes in father's earnings with changes in orders among fathers in couples that had their first child support ordered in 2000.⁶⁶ There also are many anecdotes of obligated parents who quit working or turn to unreported employment (also called the underground economy) once wages are garnished for child support.

These studies are of limited value for this analysis because they are dated (hence do not consider today's labor market and child support enforcement practices) and not specific to Vermont. The impact of the pandemic on employment exemplifies how other factors besides child support can overshadow the employment situation. Another issue is that opportunities for income from unreported employment are rapidly changing and even more difficult to research. Before the pandemic, it was becoming more common to have multiple jobs where one may be unreported employment and the other may be reported employment. There is also evidence that self-employment has increased since the pandemic began. These multiple factors limit the ability to isolate the impact that child support may be having at this time.

COMPARISONS

There are two sets of comparisons:

- Graphical comparisons of the existing and updated guidelines tables based on combined parental income; and
- Case scenarios.

Graphical Comparisons

Exhibit 8, Exhibit 9, and Exhibit 10 provide graphical comparisons between the amounts of the existing guidelines table and the updated guidelines table separately for one, two, and three children. Based on national data and data from other states, the vast majority of child support orders are for one or two children, and few (typically less than 10%) are for three or more children. The patterns for four and more children would be similar to those of three children.

In general, the updated table is more than the existing table and the gap between the existing and updated table widens as income increases. The gap widens because the more current economic data indicates higher income families spend more. The amounts are similar at very low incomes because of

⁶⁵ Holzer, Harry J. Offner, Paul, & Sorensen, Elaine. (Mar. 2005). "Declining employment among young black less-educated men: The role of incarceration and child support." *Journal of Policy Analysis and Management*.

⁶⁶ Ha, Yoonsook, Cancian, Maria, & Meyer, Daniel, R. (Fall 2010). "Unchanging Child Support Orders in the Face of Unstable Earnings." 29 *Journal of Policy Analysis and Management* 4, pp. 799–820.

the cap on expenditures, which was discussed in the previous section. Below combined net incomes of about \$5,000 per month, families spend more than their income on average. Rather than require those who pay child support to spend more than their income, total expenditures are capped at 100 percent, which effectively reduces the basic child support amount in the guidelines table below these incomes. This assumption is a longstanding assumption used by most states and Vermont in the development of their guidelines tables for several decades. It was discussed in the previous section.

Exhibit 8: Graphical Comparisons for One Child

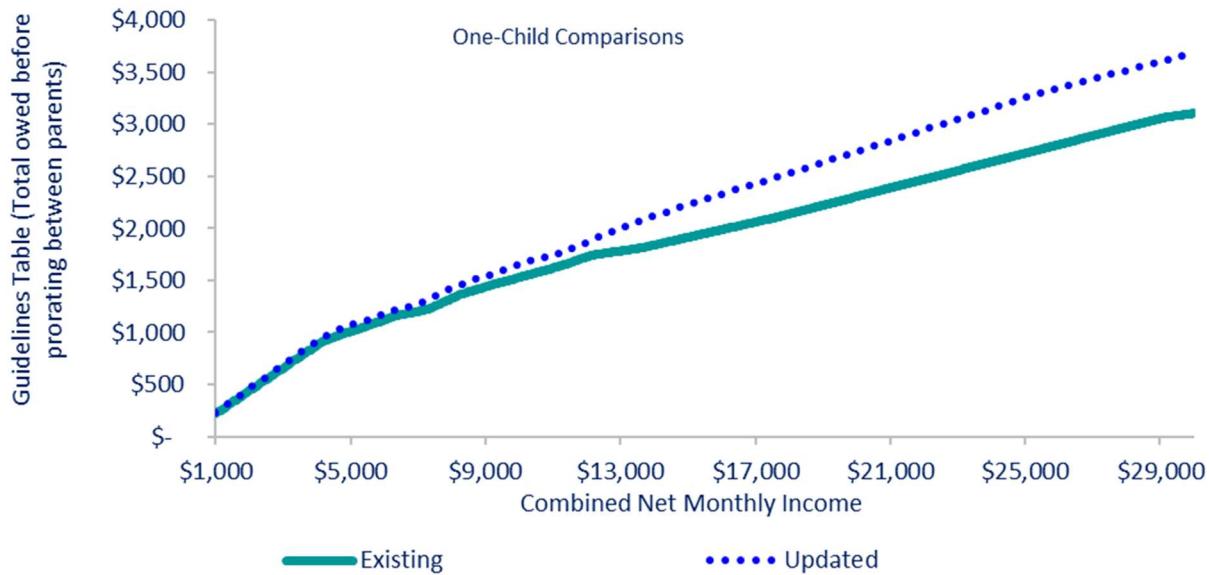

Exhibit 9: Graphical Comparisons for Two Children

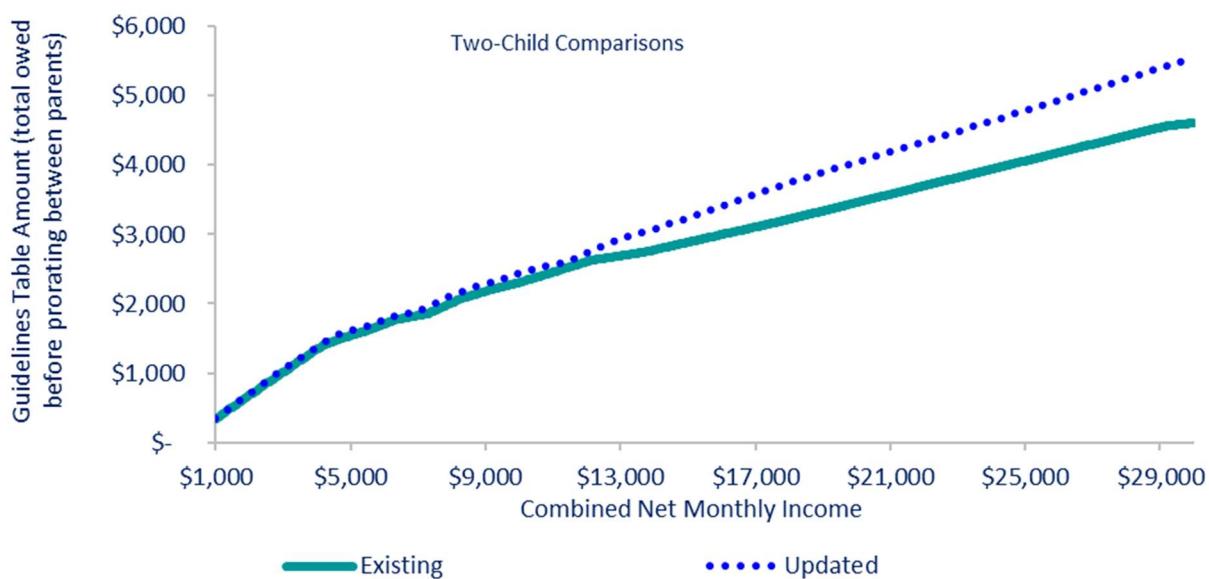

Exhibit 10: Graphical Comparisons for Three Children

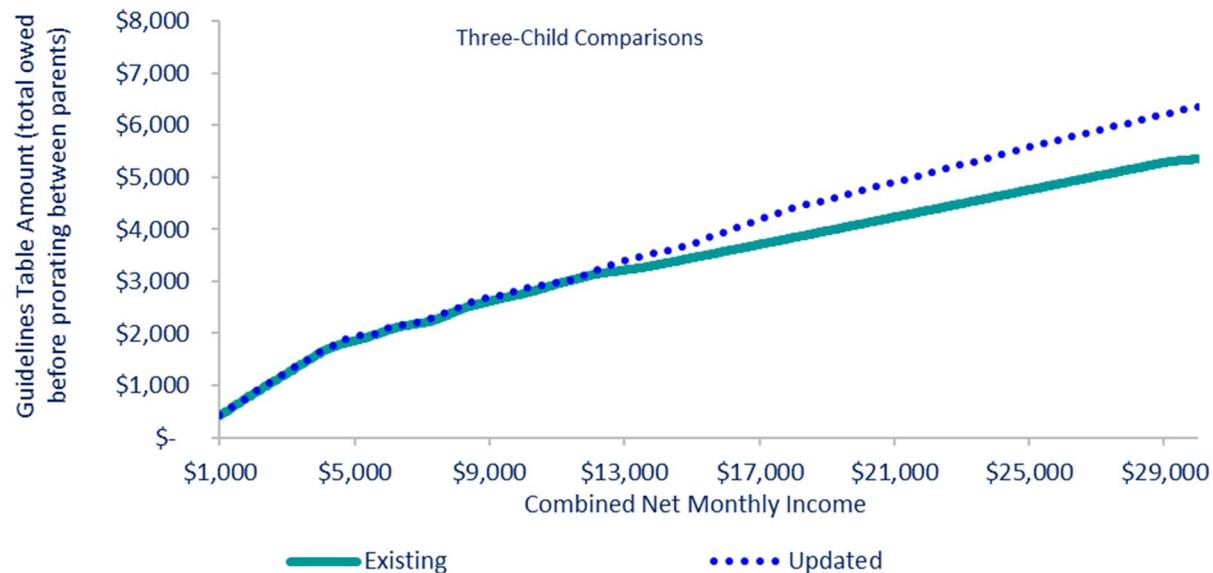

Exhibit 10 summarizes the percentage difference between the existing and updated guidelines tables for all income ranges. The side-side-side comparisons in Appendix E provide more detail because it is for each income interval. The average increase is more for one and two children (i.e., 13.3% for one child and 11.3% for two children) than it is for four or more children (i.e., 9.3%). The percentages are generally less at low incomes and higher at high incomes. For one and two children, the minimum change (4.1% for one child and 2.4% for two children generally occur at low incomes) and the maximum change (19.7% for one child and 20.5% for two children) occur at very high incomes. Exhibit 11 shows an anomalous decrease for three and more children of -0.3%. This occurs at combined net incomes of \$11,175 to \$11,495 per month. The decrease is \$13 dollar or less. This is to the basic obligation before proration. It is not clear whether the decrease results from a sampling difference (i.e., two samples may produce different results) or if there is an actual decrease in child-rearing expenditures less childcare expenses and the child's healthcare expenses over time at these incomes. The decrease does not appear in the raw estimates of child-rearing expenditures. It could be that the adjustment to exclude childcare or the child's healthcare expenses caused the decrease. Larger families may experience increased childcare or healthcare cost and shift away from other types of child-rearing expenditures.

Exhibit 11: Percentage Change between Existing and Updated Guidelines Table

	One Child	Two Children	Three Children	Four Children	Five Children	Six Children
Average Change	13.3%	11.3%	9.3%	9.3%	9.3%	9.3%
Median Change	16.7%	12.7%	8.8%	8.8%	8.8%	8.8%
Minimum Change	4.1%	2.4%	-0.3%	-0.3%	-0.3%	-0.3%
Maximum Change	19.7%	20.5%	18.9%	18.9%	18.9%	18.9%

Case Scenarios

Exhibit 12 shows the sole-custody case scenarios considered. The first two scenarios assume minimum wage earnings at an average workweek in Vermont and a 40-hour work week. The median earnings of Vermont workers by highest educational attainment and gender are the basis of case scenarios 3–7. Earnings are reported for five levels of educational attainment and gender for Vermont workers by the U.S. Census 2021 American Community Survey.⁶⁷ Male median earnings are used as the incomes of the obligated parent in the scenarios, and female median earnings are used for the receiving party's income. The last two scenarios consider high incomes. There are no adjustments to base support or deductions from income.

Exhibit 12: Summary of Case Scenarios

Case Scenario (Sole Custody)	Gross Monthly Income of Paying-Parent	Gross Monthly Income of Receiving Party
1. Both parents earn state minimum wage (\$13.18 per hour) at 33 hours per week (average hours worked in state)	\$1,885	\$1,885
2. Both parents earn state minimum wage (\$13.18 per hour) at 40 hours per week	\$2,285	\$2,285
3. Parent's earnings are equivalent to median earnings of Vermont workers with less than a high school education	\$2,826	\$1,301
4. Parent's earnings are equivalent to median earnings of Vermont workers whose highest educational attainment is a high school degree or GED	\$3,427	\$2,781
5. Parent's earnings are equivalent to median earnings of Vermont workers whose highest educational attainment is some college or an associate's degree	\$3,876	\$3,030
6. Parent's earnings are equivalent to median earnings of Vermont workers whose highest educational attainment is a college degree	\$4,542	\$3,741
7. Parent's earnings are equivalent to median earnings of Vermont workers whose highest educational attainment is graduate degree	\$6,364	\$5,304
8. High-income case (each parent's income is \$15,000 gross per month)	\$15,000	\$15,000

In addition to comparing the amounts using the existing and proposed tables, the comparisons consider guidelines in neighboring states of Maine, Massachusetts, New Hampshire, and New York. Each of these states use the income shares model except New York. New York calls itself an income shares state, but uses a flat percentage of adjusted gross income as base support and prorates additional child-rearing expenses such as child care and the health insurance premium between the parents. New York's adjusted gross income is essentially gross income less FICA. The New York formula is only presumptive for combined incomes below about \$160,000 per year, so the last scenario is not populated for New

⁶⁷ Retrieved from <http://data.census.gov>.

York. Massachusetts, New Hampshire, and New York have higher guidelines compared to other states across the nation. Consequentially, comparing Vermont to its neighboring states does not reflect how Vermont fares nationally.

The Maine guidelines were just updated to the BR5 study. Any difference between the updated Vermont guidelines table and the Maine guidelines can be attributed to differences in state income tax rates, differences in federal tax years considered, changes in price levels since Maine developed its updated table, differences in the Vermont and Maine low-income adjustment, and a small adjustment for Maine's price parity. The New Hampshire guidelines are a compromise between previous amounts based on the Espenshade study and an earlier BR study. The New York guidelines are based on the 1981 van der Gaag study. The amounts of the Massachusetts child support guidelines were determined largely by policy, but with consideration of various economic studies.

Exhibit 13–16 show the results of the case comparisons for one, two, and three children. The general findings are:

- There is no difference between the existing and updated amounts when the low-income adjustment applies. This is illustrated in Case 1 for all number of children and in Cases 2 and Cases 3 for two and three children.
- New York has a more generous low-income adjustment than Vermont. The other states are less generous.
- Once the low-income adjustment is no longer applied, the differences between the existing amounts and updated amounts are small (i.e., less than \$50 per month increase) for most of the scenarios. The notable exceptions are the three highest income scenarios (Cases 6, 7, and 8). The maximum difference increases with the number of children.

Shared Custody Cases

The Vermont guidelines instructs users to use a different gross to net income conversion table in shared-custody cases but the same guidelines table. Exhibit 19 and Exhibit 20 compare the same case scenarios (except for Cases 1, 2, and 8) only for shared custody cases. The excluded cases have equal incomes—hence, would produce a zero order. The scenarios consider one and two children because most orders cover one or two children. The assumption is equal custody (i.e., 50/50% timesharing.) These comparisons do not include the guidelines of other states because New York and New Hampshire do not provide a presumptive parenting-time adjustment in their guidelines. Massachusetts provides an unusual adjustment for equal custody and when one parent has two-thirds of the time with the child. The Maine timesharing adjustment is similar to the Vermont adjustment.

Exhibit 19and Exhibit 20 illustrate very small differences in equal custody cases between application of the existing tables and updated tables. Further, the difference is not always consistently more (e.g., there is a decrease from a \$82 per month order under the existing guidelines to a \$77 per month order under the updated tables for one child for Case 5). Although there is generally an increase in the guidelines table, the updated gross-to-net conversion table shifts each parent's prorated share because changes in the effective tax rate is not uniform across incomes. This shift can cause decreases.

Exhibit 19: Shared-Custody Orders: One Child when Equal Timesharing

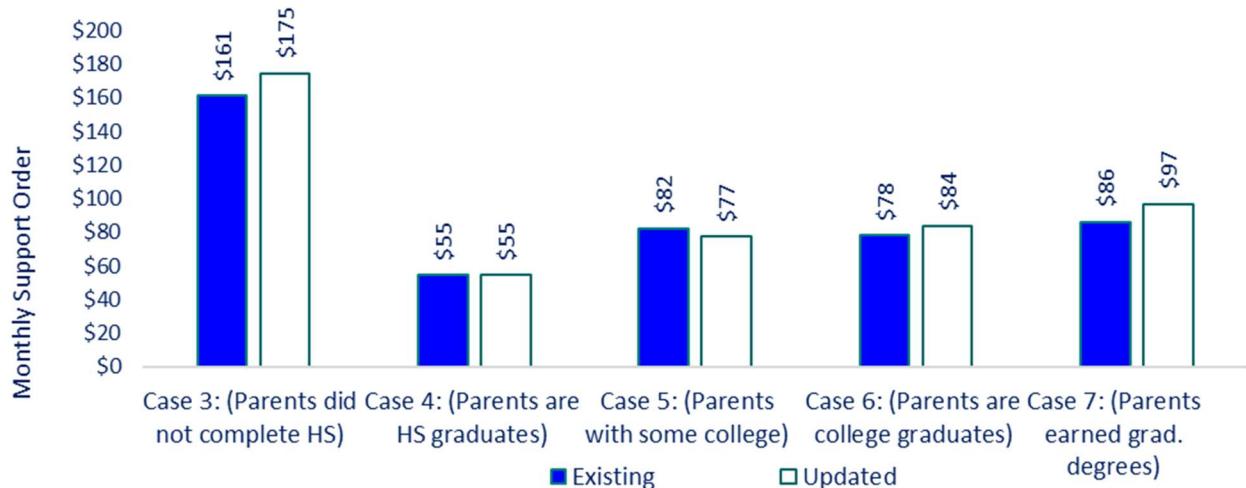

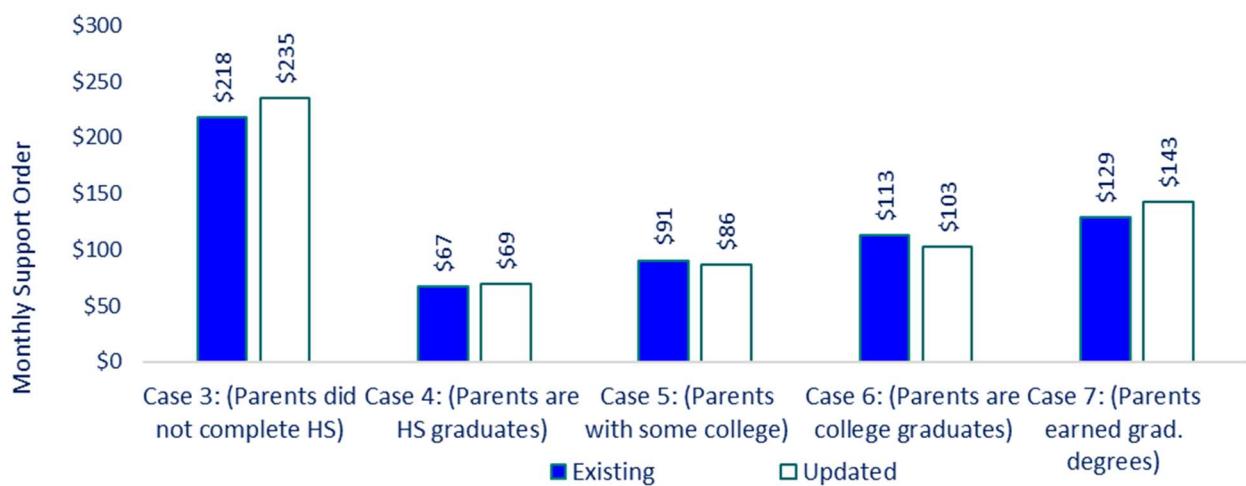

Exhibit 20: Shared-Custody Orders: Two Children when Equal Timesharing

Changes in Income Conversion Tables

Exhibit 21 and Exhibit 22 show the percentage difference between the existing and updated income conversion tables. The average increase is 1.4 to 1.7% depending on whether it is the noncustodial parent, custodial parent; sole or split or shared custody; and the number of children. The differences are fairly small because there has not been significant tax changes and the inflationary changes to other components of taxes (i.e., federal and state income tax rates, FICA, the EITC and the additional child tax credit) interact with each other and the child tax credit, which is not updated for inflation. The maximum increase also varies: 3.5% to 4.5% for the custodial parent with sole or split custody or shared custody depending on the number of children while the maximum increase is only 2.5% for the noncustodial parent. The maximum increase generally occurs for custodial parents and parents with shared custody around incomes of \$1,600 to \$4,000 gross per month. There is some shifting in the tax brackets due to inflation that affect the income tax, EITC and additional child tax credit. Since the EITC increases, reaches a peak, than gradually decreases (i.e., is a inverse "U" shape), the EITC with

interaction with the additional child tax credit creates some odd patterns in this income range including the increase for two children being larger than the increase for three or more children. The peaks of these credits vary with the number of children. Also, the maximum increase under income conversion tables for shared custody than for sole and split custody is more because it is assumed both parents take the EITC.

The noncustodial parent has less variation because they are not eligible for the child tax credit nor the additional child tax credit; and, the EITC for childless adults applies to a very limited income. There is a nominal decrease in the noncustodial parent's after-tax income around about \$13,000 - \$14,000 gross per month due to the increase in the maximum income eligible for the social security tax and the shift in income brackets due to inflation. This decrease is never more than \$10 per month.

Exhibit 21: Percentage Change between Existing and Updated Income Conversion Table: Sole and Split Custody

	One Child	Two Children	Three Children	Four Children	Five Children	Six Children	Noncustodial Parent
Average Change	1.6%	1.7%	1.7%	1.6%	1.6%	1.6%	1.4%

Maximum Change	3.9%	4.4%	4.5%	4.3%	4.0%	3.9%

SECTION 5: CONCLUSION

The Vermont guidelines consists of three tables. There are two gross to net income conversion tables: one for sole and split custody, and the other for shared custody. There is also a table of basic obligations that shows the basic obligation for a range of combined parental incomes and number of children regardless of the custody situation. This is often called the “guidelines table.”

The three tables were developed in 2019. Federal regulation requires states to periodically review their child support guidelines. As part of the review, a state must consider economic data on the cost of raising children, labor market data, and the impact of the guidelines on low-income families and paying parents. This report fulfills these three requirements. This report uses more current economic data on the cost of raising children to prepare an updated guidelines table. The update also considers recent inflation. Price levels have increased 19.3% since the existing guidelines table was developed. The tax conversion tables were also updated to 2023. There have not been major changes in tax rates since 2019 but inflationary changes to income brackets and the standard deduction affect the conversion.

The analysis of labor market information can inform income imputation practices and policies. The analysis of labor market data reveals that in general there are job openings in Vermont and many of them do not require higher levels of education. Many of these occupations with openings pay near or just above minimum wage. The average hours worked in Vermont is 33 hours per week. Not working 40 hours per week can further depress earnings of a low-income worker.

The impact on low-income families was examined using case scenarios created from labor market data. This included minimum-wage earnings and median earnings of Vermont workers by highest educational attainment. The updates produce no change to a small increase for most low-income cases. There is no change in the lowest income cases because the low-income adjustment applies. The low-income adjustment is applied as a last step in the calculation so is unaffected by the change in the guidelines table. Vermont provides a fairly generous low-income adjustment when compared to other states. Vermont updates its low-income adjustment, which consists of a self-support reserve annually. The increase is generally less than \$50 per month for upper low-income cases, but it is more substantial for high-income cases.

In all, updating the table is appropriate given recent inflation changes and the availability of better and more current economic data on the cost of raising children and changes in effective tax rates.

APPENDIX D: TECHNICAL APPENDIX

Most studies of child-rearing expenditures, including the BR measurements, draw on expenditures data collected from families participating in the Consumers Expenditures Survey (CE) that is administered by the Bureau of Labor Statistics (BLS). Economists use the CE because it is the most comprehensive and detailed survey conducted on household expenditures and consists of a large sample. The CE surveys about 6,000 households per quarter on expenditures, income, and household characteristics (e.g., family size). In the survey quarters used in the fifth BR (BR5) study (i.e., first quarter of 2013 through the first quarter of 2001), households remain in the survey for four consecutive quarters,⁶⁸ with households rotating in and out each quarter. Some families do not complete all of the quarterly surveys. Most economists, including Betson, use three or four quarters of expenditures data for a surveyed family. This means that family expenditures are averaged for about a year rather than over a quarter, which may not be as reflective of typical family expenditures.

In all, the BR5 study relies on expenditures/outlays data from 13,885 households in which 5,830 households were childless married couples and 8,055 were married couples with children. The subset of CES households used for the BR5 study consisted of married couples of child-rearing age (age 18 to age 60), and households with no change in family size or composition during the survey period, and for the baseline BR5 estimates, which is the basis of the updated Vermont schedule, households with other adults living in the household (e.g., adult children) were excluded.

The CE asks households about expenditures on over a hundred detailed items. Exhibit D-1 shows the major categories of expenditures captured by the CE. It includes the purchase price and sales tax on all goods purchased within the survey period. Betson consider “outlays” for both his BR4 and BR5 estimates. Outlays includes installment plans on purchases, mortgage principal payments (regardless whether it is first or second mortgage), and payments on home equity loans, while other studies do not because they used expenditures, which mimics how gross domestic product (GDP) is measured. Housing is considered an investment under GDP so mortgage principal is considered an investment not an expenditure in the BLS definition of expenditures, which was used in older studies. Both the BR4, which forms the basis of the existing guidelines table, and BR5 are based on outlays. Besides housing, a similar issue concerns vehicle expenses. The BLS captures all outlays during the four quarters. So, if the household bought a vehicle outright, the total cost of that vehicle would be included as an outlay. If the household financed the vehicle through a loan only the loan payments on the vehicle would be included as an outlay.

The BLS designed the CE to produce a nationally representative sample and samples representative of the four regions (Midwest, Northeast, South, and West). The sample sizes for each state, however, are not large enough to estimate child-rearing costs for families within a state. We know of no state that has seriously contemplated conducting a survey similar to the CE at a state level. The costs and time

⁶⁸ In prior years, families remained in the survey for five quarters.

requirements would be prohibitive. In recent years, however, the BLS has enhanced the sampling of the five largest states to provide individual estimates of expenditures and outlays for these states.

Exhibit D-1: Partial List of Expenditure Items Considered in the Consumer Expenditure Survey

Housing	Rent paid for dwellings, rent received as pay, parking fees, maintenance, and other expenses for rented dwellings; interest and principal payments on mortgages, interest and principal payments on home equity loans and lines of credit, property taxes and insurance, refinancing and prepayment charges, ground rent, expenses for property management and security, homeowners' insurance, fire insurance and extended coverage, expenses for repairs and maintenance contracted out, and expenses of materials for owner-performed repairs and maintenance for dwellings used or maintained by the consumer unit. Also includes utilities, cleaning supplies, household textiles, furniture, major and small appliances, and other miscellaneous household equipment (tools, plants, decorative items).
Food	Food at home purchased at grocery or other food stores, as well as meals, including tips, purchased away from home (e.g., full-service and fast-food restaurant, vending machines).
Transportation	Vehicle finance charges, vehicle outlays, gasoline and motor oil, maintenance and repairs, vehicle insurance, public transportation, leases, parking fees, and other transportation expenditures.
Entertainment	Admission to sporting events, movies, concerts, health clubs, recreational lessons, television/radio/sound equipment, pets, toys, hobbies, and other entertainment equipment and services.
Apparel	Apparel, footwear, uniforms, diapers, alterations and repairs, dry cleaning, sent-out laundry, watches, and jewelry.
Other	Personal care products, reading materials, education fees, banking fees, interest paid on lines of credit, and other expenses.

Gross and net incomes are reported by families participating in the CE. The difference between gross and net income is taxes. In fact, the BLS uses the terms "income before taxes" and "income after taxes" instead of gross and net income. Income before taxes is the total money earnings and selected money receipts. It includes wages and salary, self-employment income, Social Security benefits, pension income, rental income, unemployment compensation, workers' compensation, veterans' benefits, public assistance, and other sources of income. Income and taxes are based on self-reports and not checked against actual records.

The BLS has concerns that income may be underreported in the CE. Although underreporting of income is a problem inherent to surveys, the BLS is particularly concerned because expenditures exceed income among low-income households participating in the CE. The BLS does not know whether the cause is underreporting of income or that low-income households are actually spending more than their incomes because of an unemployment spell, the primary earner is a student, or the household is otherwise withdrawing from its savings. In an effort to improve income information, the BLS added and revised income questions in 2001. The new questions impute income based on a relationship to its expenditures when households do not report income. BR4 and BR5 relies on this improved income data element. Previous Betson measurements do not.

The BLS also does not include changes in net assets or liabilities as income or expenditures. In all, the BLS makes it clear that reconciling differences between income and expenditures and precisely

measuring income are not parts of the core mission of the CE. Rather, the core mission is to measure and track expenditures. The BLS recognizes that at some low-income levels, the CES shows that total expenditures exceed after-tax incomes, and at very high incomes, the CE shows total expenditures are considerably less than after-tax incomes. However, the new income questions used by the BLS ameliorate some of this perceived anomaly at low incomes. The consideration of outlays rather than expenditures at high incomes lessens some of the perceived anomaly at high incomes.

In developing child support guidelines, a long-standing assumption has been that at higher incomes the difference between after-tax income and expenditures is a form of “savings.” This includes traditional savings (*i.e.*, deposits into a bank account) and other contributions to family wealth such as mortgage principal payments, which are included in CE measurement of expenditures but not in the CE measurement of outlays.

OTHER DATA FROM THE CES

Using the same subset of the CE that Betson used to develop the measurements, Betson pulled other data necessary to develop an updated Guideline Table. This included information about child care and medical expenditures and the percentage of after-tax income that was actually spent. These statistics are shown in Exhibit D-2.

The excessive medical expense shown in the last column is a per capita amount that covers the parents and children living in the household. That is, underlying data do not track whether the insurance premium or medical expense was made for an adult’s or a child’s healthcare needs. Since medical expenses are generally less for children than adults, they are adjusted to a child-based amount using data from the National Medical Expenditure survey (NMES). Based on the 2017 NMES, the annual out-of-pocket medical expense per child is \$270, while it is \$615 for an adult between the ages of 18 and 64.⁶⁹ In other words, an adult’s out-of-medical expenses is 2.28 more than a child’s. This information is used to recalibrate the per-person excessive medical amount shown in Exhibit A-1 to a per-child amount. For example, at combined incomes of \$60,000 to \$64,999 per year, the total excess medical expense is 7.474 percent. The adjusted child amount is 7.474 divided by the weighted amounts for family members (6.1684 based on 2.28 times two adults plus the average number of children for this income range, 1.6084). The quotient, 1.212 percent, is the per-child amount for excess medical. It is less than the per-capita amount of 2.071 percent.

In general, the formula is the expenditures on child for a particular number of child minus childcare multiplied by the number of children for whom support is being determined minus the adjusted per child excess medical expense developed above by the number of children. If the total expenditures as a percentage of after-tax income (3rd column) is less than 1.0, it is multiplied by the remainder in the previous sentence. This is done for each income bracket shown in Exhibit D-1. The combined income is

⁶⁹ Agency for Healthcare Research and Quality. (Jun. 2020). *Mean expenditure per person by source of payment and age groups, United States, 2017. Medical Expenditure Panel Survey*. Generated interactively: June 12, 2020, from https://www.meps.ahrq.gov/mepstrends/hc_use/.

adjusted for changes in price levels between 2020 and April 2023. The percentages between the income ranges shown in Exhibit D-1 are interpolated to create a gradual change in the guidelines table as income increases.

Exhibit D-1: Parental Expenditures on Children and Other Expenditures by Income Range Used in the BR5 Measurements (National Data)								
Annual After-Tax Income Range (2020 dollars)	Number of Observations	Total Expenditures as a % of After-Tax Income	Expenditures on Children as a % of Total Consumption Expenditures (Rothbarth 2013–2019 data)			Child Care \$ as a % of Consumption (per child)	Total Excess Medical \$ as a % of Consumption	
			1 Child	2 Children	3 Children		(per capita)	(total)
\$0 – \$19,999	283	>200%	22.433%	34.670%	42.514%	0.473%	0.870%	3.005%
